# **Program Overview**

#### Purpose

...of this reference guide is to provide guidelines and understanding and aid in maneuvering through the customized incentive process.

This is the new *Tools and Tips for Estimating Energy Efficiency* reference guide. The guide will assist in the process and explanation of Rebates & Incentives for your business. We are excited about the new design and hope that you will find new areas that provide savings for your business.

This reference guide will work hand-in-hand with information provided by the Customer Programs Energy Efficiency Engineer staff and resources found on www.sdge.com

The course will cover the following topics:

- Understanding the program
- Describing Tools & Calculators
- Verify Energy Calculations
- Review California Public Utility Commission (CPUC) Requirements
- Program Compliance
- Consolidate Documentation
- Approve Cash Incentives

In addition, the course will help to understand how a business can reduce demand, save energy, and conserve resources.

### **Preferred Calculation Tools**

Customers submitting customized projects are asked to use the list of preferred tools when applicable. The tools listed have been reviewed by San Diego Gas & Electric's engineering groups for satisfactory use in calculating customized project savings.

While the tools listed have been reviewed, none of them are endorsed by any of the IOUs or its engineering groups. Uses of these tools are NOT mandatory. However, they are recommended to help improve accuracy and shorten review time. Project savings calculated by these tools are not pre-approved. Projects will need to be reviewed and approved by San Diego Gas & Electric to ensure inputs are appropriate and consistent with the project scope, and that all documentation is available.

	Pro	eferred Tool List
Calculation Tool	Category	Notes/Applications
AirMaster	Preferred	Air Compressor Systems
DOE2.2R	Preferred	Refrigeration measures
EnergyPro	Preferred	Residential & Non-Residential Retrofits/New Construction
eQuest	Preferred	Residential & Non-Residential Retrofits/New Construction
IDSM Online Application Tool	Preferred	Non-Residential Retrofits & Industrial Processes
LPD Calculator	Preferred	Non-Residential Lighting Retrofits (Title 24 Covered Buildings)
Motor Master	Preferred	Motors Replacements
Sim Calc2	Preferred	Non-Residential New Construction – System Approach
TRACE 700	Preferred	Non-Residential Retrofits

The table below includes a list of preferred calculation tools.

Note: This list will routinely be updated for new versions, software phase out (i.e. SDG&E moving to Online Application), and stakeholder recommendations on new methodologies.

Note 2: Newest Version should be used at all times, Inter-version (e.g. 1.2.1 vs. 1.2.3) are okay, only if changes do not impact calculation method in a significant way (i.e. savings significantly different from previous version).

To begin please locate the applicable industry using the list of businesses types the utility provides rebates and incentives. It is helpful to become familiar with the guidelines necessary for the type of improvements being performed. Locate your rebate and/or incentive at <u>http://www.sdge.com/rebates-finder/business</u>

#### Energy Efficiency Business Rebates

Earn rebates on your improvements. Energy Efficiency Business Rebates help business customers...

Read More

SDG&E's Energy Efficiency Business Incentives can help you save a significant amount on your energy bill. Earn cash incentives based on the amount of energy you save when you retrofit existing equipment or install new high-efficiency equipment.

#### The more you save, the more you earn

Benefit from cash incentives for retrofitting existing or installing new high-efficiency equipment to save energy. Your incentive amount is driven by the amount of energy the project saves. The more you save, the more you earn — up to 50 percent of your project cost, or 100 percent of the allowable incentive amount. In addition to the incentive, eligible participants can now receive a comprehensiveness bonus.

Energy Efficiency Business Incentives

Learn more about Energy Efficiency Business Incentives here.

Read More

# Process

The Statewide Customized Retrofit Offering ("Offering") provides financial incentives for non-residential customers to install new, high-efficiency equipment or systems, otherwise referred to as measures.

*Measures* must exceed applicable code and/or industry minimum efficiency standards to qualify and must operate and produce verifiable energy savings for at least five years. Applicable projects may consist of the retrofit of existing equipment/systems or the installation of equipment associated with new or added load.

*Incentives* are paid based on kWh, peak kW, and/or therms saved by the installation of the new equipment or system per calculations or Measurement & Verification (M&V) compared to baseline energy performance. Baselines are determined by *measure classification*, which may vary from the actual energy use of the existing equipment. Incentives for peak demand reduction (peak kW) are paid on the peak demand permanently reduced as a result of the project which may vary from total demand savings.

#### **Typical Process Steps**

Customer / Project Sponsor		Utility Adr	ninistrator	Project Sponsor	Utility Administrator			
1.Review	2. Application	3. Application	4. Application	5. Project	6. Installation	7. Incentive		
Offerings	Submission	Review	Approval	Installation	Review	Payment		

Project Sponsor/Authorized Agent is required to follow a multi-step application process using forms specific to the Customized Retrofit Offering. The forms are submitted to the Utility Administrator for review and approval prior to beginning project work, which includes demolishing, purchasing or installing equipment. Pre and post-inspections in the review phases will be required. The Utility Administrator will work closely with the Project Sponsor/Authorized Agent to facilitate the review and payment process.

Participation in the Offering is entirely voluntary. Applicants incur all costs associated with preparing an application, installing equipment, conducting measurement and verification activities, and otherwise reviewing or executing the Offering agreement. In return, Customers (or otherwise indicated payee) receive cash payments and acquire high-efficiency equipment that will help lower energy costs and reduce energy consumption.

Page purposely left blank

# Lighting

# **Custom Lighting Calculations**

To begin, the custom energy savings calculations for lighting, each participant should become familiar with the necessary websites and have an understanding of the lighting programs. The Energy Efficiency Business Incentive (EEBI) is the program.

Lighting tables are located on the company website <u>www.sdge.com/eebi</u> Approved lighting fixture and LEDs must be on Appendix E and Appendix F Located at the bottom of the site under additional resources

http://www.sdge.com/rebates-finder/save-energy-earn-incentives

Approved fluorescent lamps and ballast must be on the Consortium for Energy Efficiency (CEE) website:

http://www.cee1.org

### Title 24, 2013 and Lighting

The California Public Utility Commission has mandated utilities to calculate current Title 24 code as existing base-case.

Title 24 indoor lighting is the allowed lighting power the 2013 building energy efficiency standard also known as the allowed lighting power which is in Watts

The 2013 Title 24 update is the *new* mandatory code lighting control

- Automatic daylighting control is in primary day light zones
- Hotel/Motel guestrooms captive card, occupancy sensing lighting controls, and occupancy sensing receptacles
- Automatic lighting controls for multi-family and hotel/motel corridors
- Occupancy sensors in warehouses, libraries, offices, classrooms, conference rooms, and multipurpose rooms
- Occupancy sensor lighting in parking garage spaces and outdoor luminaires < 24 feet must have motion sensors to reduce light levels</li>

### Lighting Power Density (LPD) and Dual Baseline

Lighting Power Density (LPD) is the lighting power requirement defined by the American National Standards Institute (ANSI), American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE), and the Illuminating Engineering Society of North America (IESNA) lighting subcommittee.

Lighting Power Density technically represents the load of any lighting equipment in any defined area, or the watts per square foot of the lighting equipment. However, in the lighting industry it is often associated with the lighting power allowance (LPA) permitted by the building energy code.

The lighting table will calculate LPD and dual baseline.

First baseline is calculated by the lighting audit. It calculates the actual lighting power.

Second baseline and LPD is automatically calculated. Title 24 maximum allowed lighting power LPD using the formula below

$$LPD = \frac{Watts}{Sq.FT}$$

#### Calculating LPD – Data Collection

Step 1:

Collecting wattage and an item count for all permanent ceiling, wall lighting, and floor mounted lighting in each zone.

**Note:** Decorative, task and egress lighting is not included.

Step 2:

Collect square footage for space or building.

**Note:** If existing LPD is lower than current code LPD then the first baseline and second baseline are the same.

Picture 1

The new Customer Energy Savings Calculation spreadsheet has been designed to simplify the process when capturing the necessary details for a project.

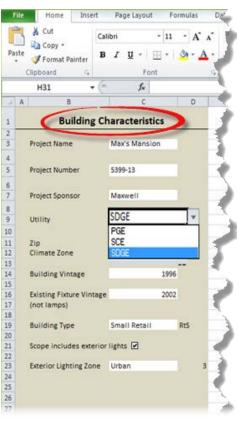

#### **Building Characteristics**

The input section on the left-hand side of the spreadsheet captures the building's characteristics. See Picture 2

<u>First Step</u>: requires identifying the features of the project.

Enter characteristics for the building

- Project name
- Project number assigned (leave blank if unknown)
- Project Sponsor
- Utility
- Zip code
- Climate Zone
- Building Vintage
- Existing fixture vintage
- Building type.
- Exterior Lighting Zone

Additionally, if the scope of work includes exterior lights, the box must be checked. Picture 2

#### General information – will detail:

- Location description
- Fixture age

#### Existing lighting equipment – will detail:

- Fixture count
- Fixture code

### Existing Lighting Equipment

<u>Step Five</u>: Enter existing lighting equipment into table.

A window will appear with a drop-down where you can identify what type of existing fixture.

**Note:** Under existing lighting equipment please <u>include all</u> <u>existing fixtures in zone</u> even if they are not being replaced.

#### Proposed Lighting Equipment – will detail:

- Existing fixture replacement (yes/no)
- Proposed Fixture Count
- Proposed Fixture Make/Model
- Proposed Control Type
- Proposed Occupancy Sensor Count

Step Six: enter proposed equipment into table

Indicate whether an existing fixture is being replaced. *Note:* <u>If no is</u> <u>entered</u>, the savings will be zero. This will calculate the existing LPD.

The energy savings is calculated by the Peak KW savings, which is the Pre-KW minus the Post KW, multiplied by the DEER Coincidence Factor (CF). The DEER Coincidence Factor is the factor that the lights will be off during peak hours. The kWh savings is the Pre-KW minus the Post-KW multiplied by the Pre-operating hours.

The lighting table will correlate the first baseline and the second baseline

#### **Measurement & Verification**

M&V is performed on projects that are proposed >20% higher than Deemed and/or DEER savings.

M&V projects must be minimum 50,000 kWh savings or requested by utility engineers or the CPUC.

Page purposely left blank

# Hotel/Motel Guestroom Controls

## **Guest Controls**

Significantly reduce energy consumption in a hotel guest room when a guest is away. Controls range from lighting controls to HVAC equipment controls.

## HVAC Equipment Controls

A thermostat combines the operations of a state-of the-art programmable digital thermostat with a sensing device. The built-in occupancy sensor detects the presence or absence of room occupants.

Other versions of guest controls may require a card key control system from the door. When the guest accesses the room using their guest card, the HVAC system is then triggered within the room.

The HVAC and card key control units work seamlessly when the door sensor signals the thermostat that the door has been opened. When the guest enters the room, the sensor detects their presence and automatically sends a signal to the room's HVAC, signaling that the room is occupied. The heating/cooling system begins operations in accordance with the pre-programmed room occupied settings.

This may be to heat the room to a predetermined temperature, or to cool the room. When the room is unoccupied, the system will work in reverse and begin to shut down the system.

#### Lighting Controls

Wall switches and wall outlets may also be conveniently activated by the master key card switch. When these controls are installed, all lighting devices are activated at the time the key card is inserted into the master switch. Once activated, operates as expected. The controlling technology for all electrical outlets and switches are generally wireless; eliminating the need to run wires during the installation process.

#### **M&V Criteria for Controls**

#### Large hotel projects require M&V to prove savings

Certain criteria is necessary on how to perform the measure and the tools when estimating savings The utility standards originate from the International Performance Measurement and Verification Protocol (IPMVP) Standards for sampling.

This requirement is generally triggered when savings is >50,000 kWh of claimed savings per project. Included documentation required in this measure is capturing measurements and performance of each selected room. (I.e. number of sample sizes and sample rooms). This requirement is dictated based on the number of guestrooms within the hotel/motel.

For the sampling, the utility need to include different orientations of the building, rooms located on the North, South, East, and West of the building. As well as include booking rates. The rates are required to classify the trends and fluctuations within the hotel/motel. This documentation allows viewing the low, mid, mid-to-high, and high seasonal points in the industry occupancy. The data enables the engineering team see and understand the dynamics of the hotel/motel's occupancy per building. M&V needs to see the different changes or booking rates within a 12 month period. Collecting these trends and billing data, the M&V team develops specific conditions specific to the site.

The criterion is calibrated using an E-Quest model to generate savings potentials. Engineering will need the following documentation:

- Guest room thermostats verification of the install guestrooms thermostat settings
- Heating and cooling modes for occupied and unoccupied times
- Points when housekeeping or the customer instructs the housekeeper to reset the thermostat
- Time housekeeping is cleaning the room.

# Title 24, 2013 for Controls

New Construction Applications:

On July 1, 2014 the utility adopted the new 2013 Title 24 Standards, which require hotel/motel guest room controls (Key card or motion sensor type).

Retrofit Applications:

Hotel/Motel guest room controls can only be considered for incentive if the existing thermostats have remaining useful life (RUL).

As an example, if the guest room existing thermostats are programmable, with useful life of 11 years and the programmable thermostats were installed eight years ago there is three years remaining useful life. With three years RUL, the retrofit would be eligible for an incentive.

#### Set-points:

Set at least +5°F above in cooling mode

Set at least -5°F below in heating mode

Page purposely left blank

# Chillers

This section reviews only constant speed chillers, how and what types of tools the utility uses to conduct an estimate savings for chiller replacements. In order for the utility to estimate savings for chillers, the utility engineers use four specific types of tools.

- READI tool
- Customized Calculation Tool (CCT)
- E Quest
- Spreadsheet Calculations for complex chiller projects, using raw data.

#### Title 24, Part Six

It is important to understand the changes under Title 24, Part Six. Under this section, a comparison of current standard vs. old or outdated Title 24 standards. *Note: The efficiencies have been raised under new Title 24, 2013 Standards.* There will be a breakdown between the different size chillers.

Familiarization with the Database for Energy Efficiency Resources (DEER) provides the latest information about the efficiencies used in the READI tool.

Next, understanding the Energy Efficiency Business Incentive (EEBI) programs and how incentives are claimed for chiller projects.

http://www.sdge.com/save-energy-earn-incentives

Lastly, understanding Climate Zones and identifying the different climate zones for multiple buildings when conducting an audit for a chiller project is important and valuable to establish an energy efficiency building.

http://www.energy.ca.gov/maps/renewable/building\_climate\_zones.html

# Using the Correct Tool with Data Collection

A data collection sheet should be taken to the site and completed. Information defined on the data sheet will define the scope of the project. See data sheets in handout appendices.

- One for one replacement?
- Upgrade back-up chiller to lead chiller?
- Multiple Chillers at site?
- Multiple Capacities / Increased Capacity
- Modifications

In addition, nameplate data for existing chillers should be collected. Spot reading – (chilled water temperatures, condensing water temperatures flow rates, chiller load (amps) should be recorded, when available). Consult the plant operator about chiller operating schedules and chiller loading. Refer to refrigeration workbook.

- Building Type, Vintage, and Conditioned Area (Sq. Ft.)
- Hours of Operation
- Climate Zone / Zip code
- Operating Conditions water temps, GMP flow, etc.
- New Chiller Type, Tons, Efficiency (kW/ton), VSD
- Chiller Operation- Lead-Lag? Shared Load? Age?
- Additional Plant Chillers- type, capacity, operation

#### Centrifugal Chiller Example – READI Tool:

This is a READI example, for replacing an existing chiller, with one chiller onsite. Dual Baseline review is covered by this example.

Building and Equipment Characteristics: :

- Large Office located in 92128
- Vintage of building is 1997
- Existing Chiller: 350 tons, water-cooled, centrifugal
- Proposed Chiller: 350 tons, water-cooled, centrifugal, efficiency = 0.461 kW/ton
- DEER EUL = 20 years; Title 24 = 0.576 kW/ton

READI specifies replacement chiller performance (kW/ton).

#### READI input screen

#### Energy Impacts – Output Information

ew Tools Help		-								
tro & Help Measures	Energy Impacts	Technologie	es Classificati	on Trees Su	pport Tables					
Energy Impacts										
Measure Description:	Water cooled centri	ifugal chiller (>=	= 300 tons, 0.461 kV	V/ton)						
Energy Impact ID:	NE-HVAC-Chir-Cer	NE-HVAC-Chir-Cent-gte300tons-0p461kwpton-ConstSpd								
Measure ID (linked):	NE-HVAC-Chir-Cer	nt-gte300tons-0	p461kwpton-Const	Spd						
DEER Energy Imp	act Values:		All impacts ar	e per Cap-To	ons"					
	Whole	Building Imp	acts	Direct	acts					
	(kWh/unit)	kW/unit	therm/unit	kWh/unit	kW/unit	therm/unit				
Above Pre-Existing	309	0.178	0	0	0					
Above Code/Standard:	123	0.0713	0	0	0					
1011	Building Type		Building Vin	tage	Building Lo	cation				
IOU										

The new Chiller Efficiency Evaluated will equal the READI chiller efficiency.

**Above Pre-Existing** is savings above *a survey of typical chillers* in service. It will be used to evaluate the first baseline – existing to new.

<u>Above Code/Standard</u> is savings above current Title 24 Code. It is used to evaluate second baseline – code to new.

The building type, vintage, and location (climate zone) are defined.

The savings impacts are defined as a function of chiller capacity.

	<u>Whole</u>	Building Imp	acts
	kWh/unit	kW/unit	therm/unit
Above Pre-Existing	309	0.178	0
Above Code/Standard:	123	0.0713	0

Calcs	kWh Savings	kW Savings	Measure
RUL>1	(350 x 309) = 108,150	(350 x 0.178) = 62.3	ER
RUL<1	(350 x 123) = 43,050	(350 x 0.0713) = 25.0	ROB

See the appendix for DEER measure life values. Water cooled chillers have a 20 year life. Since this chiller was installed in 1997 it has a remaining useful life of four years.

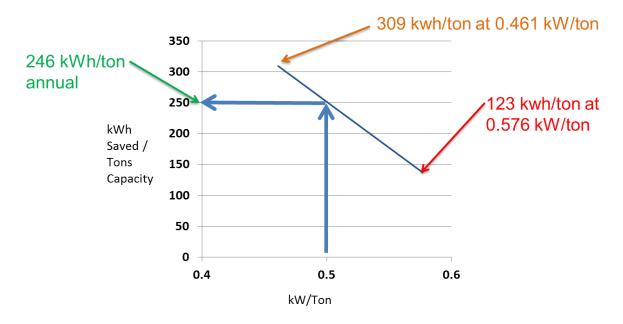

**Vintage** = 1997, **RUL** = 4 years (20 years – 16 years), which qualifies for Early Retirement (ER).

If RUL < 1 years; Replace on Burnout (ROB)

Note: First baseline and second baseline energy and demand savings are calculated. Incentives are calculated based on First Baseline Savings.

- First Baseline Savings = 108,150 kWh savings & 62.3 kW savings
- Second Baseline Savings = **43,050 kWh** savings & **25.0 kW** savings

Chiller evaluated using unmodified READI are not reviewed by Energy Division.

# Centrifugal Chiller Example – Modified READI

The above example evaluates savings for a new 350 ton chiller with full load efficiency of .5 kW/ton

Since READI does not list a .5 kW/ton chiller, savings must be interpolated from READI.

Calculating:

- 1. Plot kWh-saved vs. chiller-efficiency. The READI run provides two valuesabove pre-existing and above code. Current code is .576 kW/ton.
- 2. By drawing the graph and locating the .5 kW/ton kWh savings above the pre-existing (First Baseline Savings) can be determined

Measure ID (linked):	NE-HVAC-Chir-Cer	NE-HVAC-Chir-Cent-gte300tons-0p461kwpton-ConstSpd							
DEER Energy Imp		All impacts a	re "per (						
Whole Building Impacts									
	kWh/unit	kW/unit	therm/unit	kWh					
Above Pre-Existing	309	0.178	0						
Above Code/Standard:	123	0.0713	0						
IOU	Building Type		Building Vir	ntage					
All	Office - Large		1993 - 20	001					

Since READI is used with changes, the calculations are reported to Energy Division for review.

Linear Interpolation Equation

$$y = y_0 + (y_1 - y_0) \frac{x - x_0}{x_1 - x_0}$$

Where  $\gamma$  = Modified-READI Savings;  $\chi$  = 0.500 kW/ton

 $y_0 = 309 \text{ kWh/ton}; x_0 = 0.461 \text{ kW/ton}$ 

 $y_1$  = 123 kWh/ton;  $x_1$  = 0.576 kW/ton

y = 246; same as plot method

**Vintage** = 1997, **RUL** = 4 years (20 years – 16 years), which qualifies for Early Retirement (ER).

If RUL < 1 years; Replace on Burnout (ROB)

Note: First baseline and second baseline energy and demand savings are calculated. Incentives are calculated based on First Baseline Savings.

- First Baseline Savings = 86,100 kWh savings & 49.7 kW savings
- Second Baseline Savings = 43,050 kWh savings & 25.0 kW savings

Calcs	kWh Savings	kW Savings	Measure
RUL>1	(350 x 246) = 86,100	$(350 \times 0.142) = 49.7$	ER
RUL<1	(350 x 123) = 43,050	(350 x 0.0713) = 25.0	ROB

First and second baseline savings are calculated like the previous example.

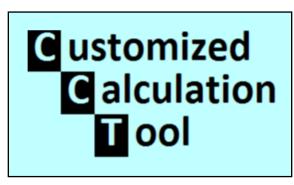

**Note:** If there are multiple site chillers with different efficiencies, the READI tool or modified READI cannot be used.

# Centrifugal Chiller Example – Customized Calculation Tool, 2013:

The Customized Calculation Tool is provided with the *Statewide Customized Offering Procedures Manual for Business* 

Use the data sheet provided in the appendix to collect site data. The tool limitations are similar to READI. Generally the tool will not work at sites with multiple chillers and multiple efficiencies.

If there are two site chillers that are identical, and the two chillers equally share the load or run alternately, then this method can be used.

Used for most common building types and sizes:

- Education
- Health/Medical
- Lodging Hotel
- Large & Small Offices
- Retail

Look at the same chiller used with the READI example, the building size is estimated for this example at 400 Sq. Ft. / ton

Building and Equipment Characteristics:

- Large Office located in 92128
- Vintage of building is 1997
- Existing Chiller: 350 tons, water-cooled, centrifugal
- Proposed Chiller: 350 tons, water-cooled, centrifugal, efficiency = 0.5 kW/ton
- DEER EUL = 20 years

Input Sheets – Customized Calculation Tool-2013

First Input Sheet- Measure Description

Select the incentive category and Measure Type

# Fifth Input Sheet –Chiller Information

	Building Measure Specif	ication
Area Served:	140,018 <b>ft2</b>	
	Baseline	Measure
Year Manufactured:	2003 Overhauled	
YearOverhauled:		
Chiller Types(s):	Electric Centrifugal Hermetic	Electric Centrifugal Hermetic
Condenser Types(s):	Water-Cooled	Water-Cooled
Compressor(s):	Constant Speed	Constant Speed
Chiller Counts & Sizes:	1 Auto-size  >=300 tons	1 Auto-size >=300 tons
Chiller Efficiency:	0.634 kW/ton	0.500 kW/ton
		Program Baseline Efficiency 0.576 kW/ton (early retirement)

Enter capacity and efficiency for the new and existing chiller. If existing chiller efficiency is unknown, use the default efficiency corresponding to vintage Title 24 for the existing chiller.

This efficiency, compared to the new chiller efficiency will develop the First Baseline Savings.

Note: the Program Baseline Efficiency is used for the Second Baseline Savings.

# <u>Output</u>

Compare these savings to the Modified READI Example: kWh and kW

# Centrifugal Chiller Example – eQUEST

Below is an example using the eQUEST schematic design wizard, for replacing an existing chiller, with one chiller on-site. Dual Baseline review is covered by this example.

Building and Equipment Characteristics::

- Large Office located in 92128
- Vintage of building is 1997
- Existing Chiller: 350 tons, water-cooled, centrifugal
- Proposed Chiller: 350 tons, water-cooled, centrifugal, efficiency = 0.5 kW/ton
- DEER EUL = 20 years

# Measurement & Verification Example, 2013 Title 24

Page purposely left blank

# Chillers with Variable Speed Drive (VSD)

This section probes deeper into energy savings from adding a variable speed drive (VSD) to a chiller. There are three methods the utility uses to analyze

these projects.

The following tools are used to analyze energy savings for chillers with VSD.

- Modified READI Tool
- Customized Calculation Tool
- eQuest

Preferred analysis tool is READI, followed by CCT and then eQUEST software.

The eQUEST software allows the project to include multiple chillers at a site.

Below is the chiller data used to evaluate the savings for a variable speed drive.

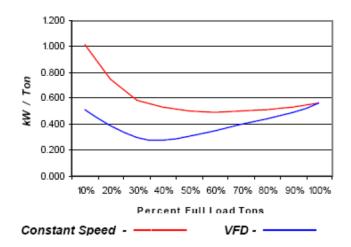

**Required Data** on the existing chiller:

- Manufacturer/Model number
- Age
- Serial numbers
- Number of Chillers How the chiller(s) operate
- Capacity in tons
- Type Screw, Centrifugal
- Full load efficiency

Required Data on building:

- Type Office building, Hospital, Hotel, etc.
- Vintage Year Built
- Location Climate Zone
- Conditioned Area
- Operating hours
- Economizer

The inputs should provide enough information using either the READI Tool, Customized Calculation Tool, or eQUEST.

# Chiller VSD Example – Modified READI

This example is demonstrated using the modified READI tool. Chiller VSD savings is determined by comparing constant speed and SVD chiller energy impacts.

Building and Equipment Characteristics::

- Large Office located in 92128
- Vintage of building is 1997
- Existing Chiller: 350 tons, water-cooled, centrifugal, constant speed
- Proposed Chiller: 350 tons, water-cooled, centrifugal, with added VSD

This example takes place in climate zone 10. The proposed chiller will remain the same; however, a variable speed drive will be added to the unit.

<u>First Step</u>: From the Energy Impacts Tab, Select the appropriate measure from the pull-down options in Measure Description.

Measure Description:	Water cooled VSD centrifugal chiller
----------------------	--------------------------------------

Tools Help								
& Help Measures	Energy Impacts	Technologies	Classification Tree	s Support Table	es

Energy and Demand Savings are circled above.

**Above Pre-Existing** is savings above *a survey of typical chillers* in service. It will be used to evaluate the first baseline – existing to new. This is a comparison of a typical existing chiller to a new chiller at 0.461 kW/ton.

<u>Above Code/Standard</u> is savings above current Title 24 Code. It is used to evaluate second baseline – code to new. This is a comparison of 2013 Title 24 code to a new chiller at 0.461 kW/ton.

<u>Second Step</u>: From the Energy Impacts Tab, Select the chiller with the appropriate capacity range from the pull-down options in Measure Description. Then select the same full load efficiency from the Energy Impact ID drop-down.

Example:

Energy Impact ID: NE-HVAC-Chlr-Cent-gte300tons-Op461kwpton-ConstSpd

**Measure Description**: Water cooled centrifugal chiller (>= 300 tons. 0.461 kW/ton)

				1

Energy Impact Valu	Whole Bu	uiding Impacts kW/unittherm/ur		and the second	t			
Energy Impact Valu Above Pre-Existing	Whole Bu		iit kWh/unit k	W/unit therm/unit	t O			
	<u>Whole Bu</u> kWh/unit	kW/unit therm/ur	nit kWh/unit kN 021 0	W/unit therm/unit				

# Chiller Comparison – READI VSD Chiller vs. READI Chiller

	READI VSD Chiller	READI Chiller	VSD kWh savings
Above Pre-Existing savings, kWh/ton	497	317	180
Above Code savings, kWh/ton	314	134	180
	READI VSD Chiller	READI Chiller	VSD kW savings
Above Pre-Existing savings, kWh/ton	0.277	0.193	0.084
Above Code savings, kWh/ton	0.167	0.082	0.084

- Chiller VSD energy savings = 350tons x 180kWh/ton = 63,000 kWh
- Chiller VSD demand savings = 350tons x 0.084 kW/ton = 29 kW

The chart compares constant speed chiller to VSD chiller. The savings is segregated, using just the VSD portion of the savings.

# Chiller VSD Example – Customized Calculation Tool, 2013

Open the Customized Calculation Tool and select Energy Savings Calculator. Name the measure then select the category:

- a. Non Lighting/Non Gas.
- b. Retrofit
- c. High Efficiency Chillers

	A 100	0.461 kW/ton
Chiller Efficiency:	0.461 kW/ton 💌	

# Fourth Input Sheet – Measure Energy Savings Runtime Hours & Incentive (Output)

For a single chiller serving the entire building, air conditioning load equipped with VSD, the savings is **183,407 kWh** 

Measure Energ	y Savings, Runtime Hours	<u>&amp; Incentive</u>	
Demar	nd & Energy Savings Estimate		
	kW	kWh/yr	Therm/yr
Baseline Energy Usage	307.1	820,600	20,838
Code/ISP Baseline Energy Usage	307.1	820,600	20,838
Proposed Measure Energy Usage	255.2	637,193	20,838
1st Baseline Energy Savings	51.9	183,407	0
2nd Baseline Energy Savings	51.9	183,407	0

• 183,407 kWh saved, 51.9 kW demand reduced

# Chiller VSD Example – eQUEST

Below is an example using the eQUEST schematic design wizard, for replacing an existing chiller, with a new chiller (one-for-one replacement); Dual Baseline review is covered.

Building and Equipment Characteristics::

- Large Office located in 92128
- Vintage of building is 1997
- Existing Chiller: 350 tons, water-cooled, centrifugal
- Proposed Chiller: 350 tons, water-cooled, centrifugal, efficiency = 0.461 kW/ton
- DEER EUL = 20 years

# Building Creation Wizard - Baseline

Describe Up To 2 Chillers -	Chiller 1
Chiller Type(s):	Electric Centrifugal Hermetic 🔹 🕞 s
Condenser Type(s):	Water-Cooled 💌
Compression(s):	Constant Speed
chiller Counts & Sizes:	1 Specify 349.9 ton
Shiller Efficiency:	0.461 kW/ton 💌

Create an office building model. From the Chiller Input screen, select Constant Speed in the *Compressor(s)* field and enter 0.461 in *Chiller Efficiency* field.

# Energy Efficiency Measure Wizard - Proposed

Next, add a comparison model by selecting Variable Speed in the *Compressor(s)* field and enter 0.461 in *Chiller Efficiency* field.

Chiller Plant EEM
Chiller #1
Chiller Type(1). Electric Centrifugal Hermitetion - select an

Compressor(s): Variable Speed
Chiller Counts & Sizes: 1 Specify
Chiller Efficiency: 0.461 kW/ton -

## eQUEST Output Reports – Energy Savings

Below is an output of the eQUEST models comparing the two energy consumptions of both types of chillers constant speed and variable speed drive. Note: the savings is circled at the bottom of the page.

Ann	ual Electric Er	nergy by I	Enduse	(pg 1 of 4	•)							
		Ambient Lights	Task Lights	Misc Equip	Space Heating	Space Cooling	Heat Reject	Pumps & Aux	Vent Fans	Dom Ht Wtr	Exterior Usage	Total
	al Energy USE (kW se Design	395,842	51,216	521,099	0	231,097	31,940	128,598	96,004	0	0	1,455,805
	Chiller Plant EEM	395,842	51,216	521,099	0	196,634	31,484	128,598	96,004	0	0	1,420,887
Incre	emental SAVINGS (	MWh) (value	s are relative	to previous meas	sure (% saving	are relative to	base case use	), negative ent	ries indicate inc	reased use)		
1 0+	Chiller Plant EEM	0.00 (0%)	0.00 (0%)	0.00 (0%)	- <b>(</b>	34.46 (15%)	0.46 (1%)	0.00 (0%)	0.00 (0%)			34.92 (2%)

• Energy Saved = 34,460 kWh

#### eQUEST Output Reports – Demand Savings

You will notice for this example the demand savings is negative. This indicates that the model is looking at the full load operation of the chiller On-Peak and there is an energy penalty for the energy used to operate the drive.

annal France Caincid	Ambient Lights	Task Lights	Misc Equip	Space Heating	Space Cooling	Heat Reject	Pumps & Aux	Vent Fans	Dom Ht Wtr	Exterior Usage	Tota

#### • Demand Saved? = -2.4 kW (increased)

# Chiller VSD Example – Tool Savings Comparison

Varied results are provided by the three modeling techniques. Modified READI is the most simple and preferred. If the results of the modified READI Tool do not accurately represent the building performance, a model calibrated to site operating conditions and annual energy consumption can be used. All eQUEST files should be submitted with an eQUEST model.

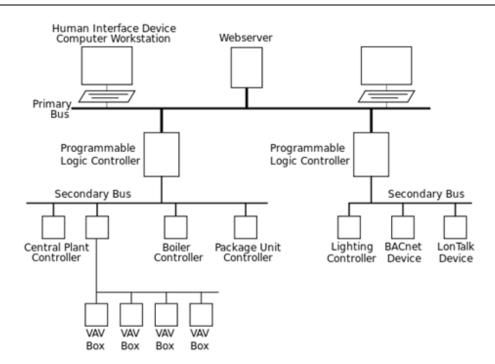

Which \	/alue	should	be	used?
---------	-------	--------	----	-------

	kWh saved	kW saved
Modified READI	63,000	29
ССТ	183,407	51.9
eQUEST	34,460	-2.4

**Note:** *M*&*V* is required for larger savings claims

Page purposely left blank

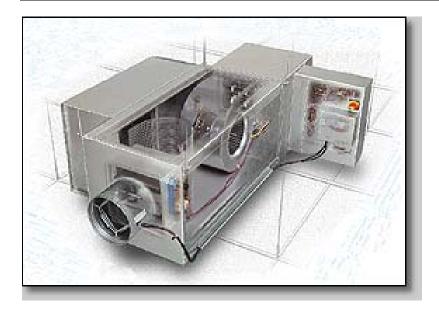

# Controls

First check the *DEER to Deemed Rebate Table* (See website and/or Appendix). Many controls incentive measures are now limited by 2013Title 24 Code requirements.

For laboratory conversions that do not trigger code evaluations, a spreadsheet analysis can be performed. Fan air flows and power are logged before and after modifications. Lab Pro is used to chiller and heating savings from reduced air flow.

# **Air Compressors**

Compressed Air Decision Diagram – Title 24, 2013

Looking at the decision chart on the previous page, will help to determine whether the changes to Title 24 code apply to the project being submitted. Beginning from the diamond, decide whether there are any centrifugal compressors. If Yes, the project is exempt from Title 24 and can be submitted. Everything would be considered baseline current efficiency. If No, the utility needs to determine the online capacity of the compressors. The actual horsepower needs to be determined, not the nameplate capacity but the actual output capacity of the compressors in horsepower.

If the online capacity is less than 25HP, this project is exempt from Title 24. This project will be handled by the rebate program EEBR. A reservation needs to be made with the EEBR group for approval on this type of projects.

If the capacity is greater than 25HP, there is a new decision point to make. Looking at the system, the vintage of the system needs to be determined. Is this a new system? If No, the system is an older system, determine whether the capacity that is going to be added or replaced will be more than 50% of the online capacity. If Yes, the decision is equivalent to a new system, and Title 24 is required. This decision will necessitate variable speed drive, storage, and controls. The new requirements do not allow for the utility to provide an incentive.

If the additional capacity is less than 50% of the online capacity, the next decision is to determine whether the online capacity is less than 100HP and more than one compressor? If No, the project is exempt from Title 24 requirements. If Yes, the additional online capacity is less than 100HP, Smart Controls are required and the utility cannot provide an incentive in this case.

If the online capacity is larger than 100 HP and more than one compressor then one needs to install smart controls. The utility cannot provide an incentive for measures Title 24 requires.

The same applies to new system lodges in 100HP when smart controls are required.

	Annual Electric Savings (kWh/HP/year)	Demand Reduction (kW/HP)
5 up to 15 HP Variable Speed Drive on Air Compressor Control	491.48	0.15264
15 up to 25 HP Variable Speed Drive on Air Compressor Control	421.65	0.13095

# 5HP – 25HP Air Compressors: Deemed Measure

Small compressors will be handled by EEBR. These projects are categorized as deemed value under two groups:

- Compressors from 5 to 15HP
- Compressor 15 to 25HP

By calculating the respective kWh, per horsepower, per year horsepower and multiplying it by respective value, the annual is determined. These projects are rebated through EEBR.

# **Compressed Air – Title 24 requirement**

This section reviews compressed air systems and the New Title 24 requirements for these components. The following topics will be discussed:

New compressed air systems and all editions alteration of compressed air with a total combined compressor powers over 25HP.

The compressed air system shall be equipped with appropriate size trim compressor in primary storage to provide acceptable performance across the range of the system and avoid control gaps. The objective is to have a system that does not consistently start and stop and is not energy efficient.

Lastly, compressed air systems with more than one compressor, having combined horsepower rating large and 100HP must operate with an approved controller that is able to choose the most efficient combination of compressors within the system based on the current air demand as measured by the sensor.

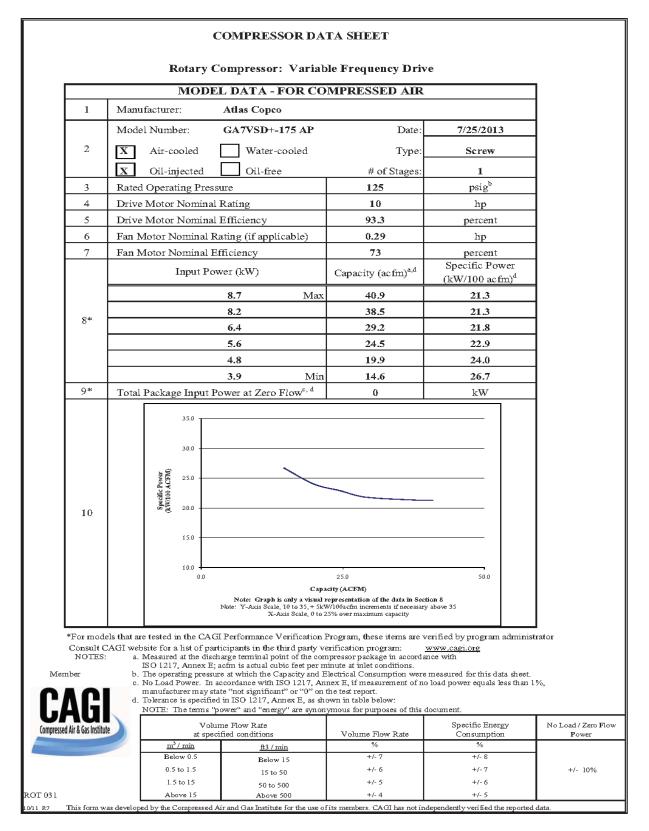

#### Air Compressor 2013 Code Requirements

Subsection 120.6 (e) of Title 24 code: Compressors larger than 25HP require trim compressor. Trim compressor may be with variable speed ability or operate at reduced load, good turndown ratio, with storage and controls. Most often businesses will install variable speed compressors rather than a small pony compressor.

# **Note:** For new installations, construction inspection and functional testing is required by the local authorities.

Air compressor project will require the submittal of a Compressed Air Gas Institute sheet (CAGI), showing the compressor demands and output in terms of CFM and KW per 100 CFM and pressure. All compressors, existing and new, will require the submittal of the CAGI sheet with values and specification specific to the compressor. (See CAGI Sheet – Next Page).

# Compressed Air Gas Institute (CAGI) Sheet

# **Custom Energy Savings Calculations**

This section discusses the different tools used to evaluate air compressors and determine savings.

- Air Master
- Custom Calculation Tool (CCT)-2013 Software Tool
- Custom Energy Savings Calculations (Spreadsheet small compressor systems)

Each tool requires measurement of the compressors. Compressors are specific to each facility. Each facility has different demand profiles. Therefore, estimations cannot be used. The utility needs to record the actual load, either CFM or the demand profile of the compressors.

This section will provide an overview of the software and the entry fields that are required for each program.

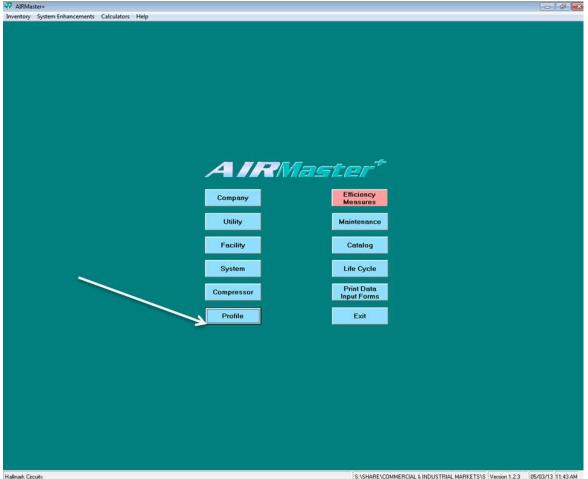

# Air Master Software Program

The first program, Air master - Developed by DOE, and Maintained by University of Washington. This software is free and downloadable using the link below:

http://www1.eere.energy.gov/manufacturing/tech\_assistance/software\_airmast <u>er.html</u>

The tab allows for a day type view for the weekday. Saturday and Sunday is a different day type compared to the work week. The datatype is different, providing readings for each day type. The system summarizes the total demand and the existing annual electric consumption; in this case, 553,241 kWh, with a total operating cost of \$71,921. The same data input is used for pre-and post-conditions to calculate savings.

# CCT-2013 Software Tool

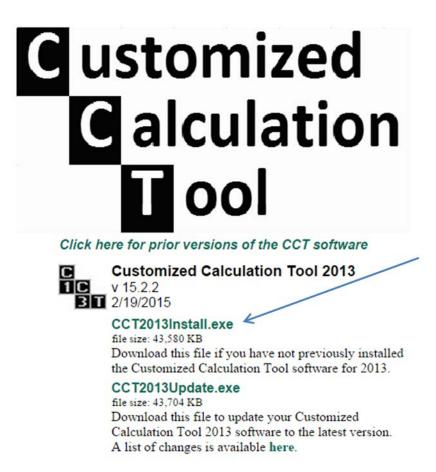

The Customize Calculation Tool (CCT tool) for Energy Efficiency Business Incentives is the second tool available for submitting compressor projects.

This software is free and downloadable using the link below:

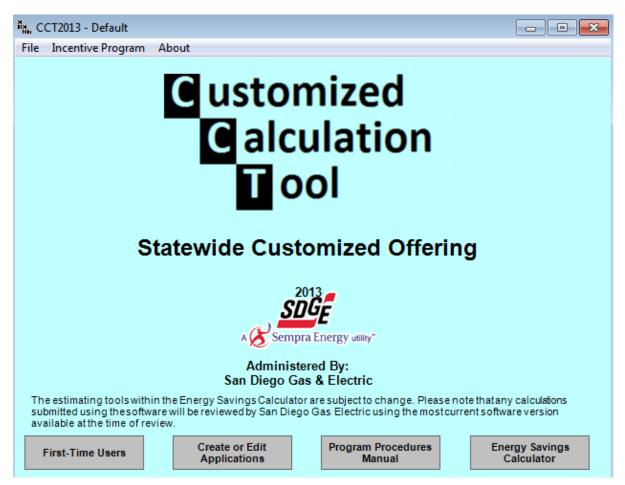

http://www.aesc-inc.com/download/spc/

First-Time Users:

Home screen view for first-time users. Download .exe file by clicking on the link identified below:

## Home Screen – Returning Users:

Very similar to previous tool, details about the compressor operation is entered.

The following pages will outline the software screens within the Customized Calculation Tool.

## Step 1: Click on Create or Edit Application

# Fifth Input – Compressor Operating Information, Schedule

The fifth input sheet requires the input of operation schedule.

- **Description** Weekday or Weekend
- Weekday Operation Yes or No
- Days/Week enter a numeric number 0 7
- Weeks/Year enter a numeric number 0 52

**Note:** In the example you see the following inputs:

- Weekday operation five days a week 50 weeks per year
- Weekend operation two days a week 50 weeks per year

#### Equipment Description for Savings Estimate **Compressor Operating Info** Day Type 1 - weekday • Compressor ID Units 12:00 AM 1:00 AM 2:00 AM 3:00 AM 4:00 AM 5:00 AM 6:00 AM 7:00 AM 8:00 AM 9:00 AM 10:00 AM 11:00 AM 22.0 Shop compressor 22.0 22.0 22.0 KW - Package 22.0 22.0 22.0 22.0 22.0 22.0 22.0 22.0 4

# Sixth Input – Compressor Operating Information, Hourly Data

The six input sheet begin with entering the Day Type from the drop-down.

- Weekday Type 1
- Weekend Type 2

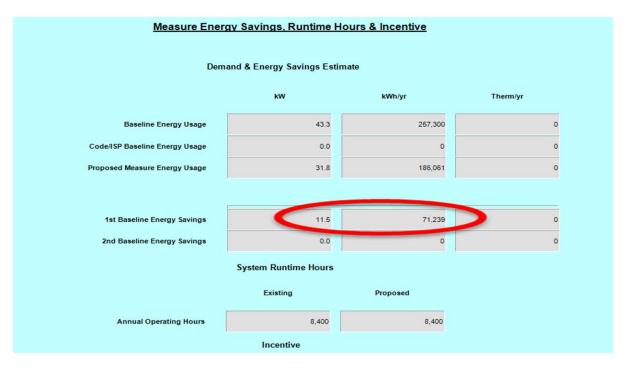

Select the Pencil Icon I to edit and enter hourly kW data.

**Note:** In the example the units are consistently 22.0 kW for the entire 24 hours.

# Seventh Input – Proposed Compressor Nameplate Data

Details about the proposed compressor are entered.

# Output Sheet – Demand & Energy Savings Estimate

Based on the data inputs, the Demand & Energy Savings Estimate is provided. The kW baseline and kW proposed is different.

The example shows a kW reduction from 43.3 kW to 31.8 kW, which renders a savings of **11.5kW**. The kWh/yr. reduction from 257,300 kWh/yr. to 186,061kWh/yr. with the proposed measure, which renders a savings of **71,239** kWh annually on the 8,400 operating hours.

#### Equipment Baseline Information

If submitting application forms, please print and attach this document.

The Energy Savings Sheet summarizes each of the measures in the project. The sheet is displayed by the specification of the compressor. The Equipment Baseline Information provides the qualifying evidence based on the year the equipment was installed and renders the effective useful life and remaining useful life.

The bottom portion of the summary sheet provides the energy savings and the Qualified Peak Demand Incentive.

estimated annual energy savings												13898

The above spreadsheet is used for small compressor systems. This is a manual process using a spreadsheet to enter the load profile, operating hours, and populating the hourly demand.

The incentive is not calculated, since this project is considered a deemed measure and is rebated through EEBR.

The deemed savings for the above 25HP compressor is 10,541 kWh versus the calculated savings of 13,898 kWh.

# Computer Room A/C (CRAC)/CRAH

This section describes processes and industry standard practices (ISP) for data centers, which includes Computer Room Air Conditioning (CRAC) and Computer Room Air Handling (CRAH) systems.

Because data centers require a much high internal load, DEER does not handle data center building types. A consortium of utilities have identified and established industry standard practices for these types of projects. A downloadable publication of *Data Center Statewide Customized New Construction and Customized Retrofit Incentive Program* is available at www.integralgroup.com

The publication provides the user with industry standard practices for data centers.

# **Data Center Baselines**

Link to download the Energy Efficiency Baselines for Data Centers – Statewide Customized New Construction and Customized Retrofit Incentive Programs study:

> http://www.pge.com/includes/docs/pdfs/mybusiness/energysavingsre bates/incentivesbyindustry/hightech/data\_center\_baseline.pdf

The study discusses the following topics:

- Air Delivery Systems (recirculation, ventilation, exhaust)
- Hydronic Systems (chilled, condenser, heating)
- Cooling Systems (air cooled dx, water cooled plant)
- Heating Systems (preheat make-up air unit (MAU), humidification)
- Humidity Control Systems (humidification, dehumidification, reheat)
- Electrical (motors, fans, VSD's, Uninterruptible Power Supply (UPS), transformers, rectifiers, servers)

Refer to the website for the current version of the publication.

# Energy Modeling Tools

Combined with actual field data, the list of tools below are used to complete the studies:

- eQUEST<sup>®</sup>
- EnergyPro<sup>®</sup>
- EnergyPlus<sup>®</sup>
- Custom Spreadsheets

EnergyPlus Energy SOFT

Note: These models do not have a data center building type. These models are designed to be used for office, restaurant, hospital, or hotel building types.

# Component Efficiencies

- 18 Separate Tables with Baselines
- Does not replace Title-24 nor ASHRAE 90.1

The publication will include 18 different tables with baselines for various subcomponents with regards to data centers. These baselines are industry standard practices specifically for Uninterruptible Power Supply (UPS). Conversion efficiencies are detailed for UPS' to establish the baseline for installation of a new UPS. The utility cannot take the actual consumption. The conversion efficiency specified in the study must be used.

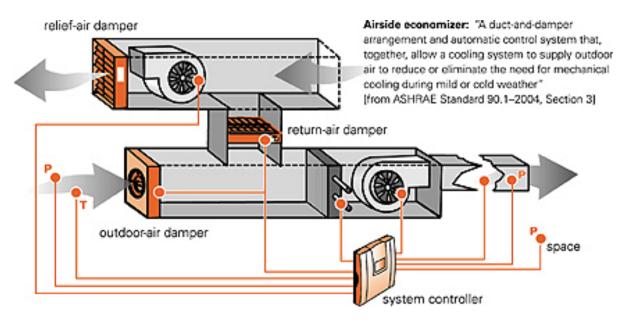

### Prescriptive Requirements

- Economizers
- Reheat
- Humidification
- Fan Power Consumption
- Fan Control
- Containment

Page purposely left blank

# **Economizers**

# Economizers – Title 24, 2013

Each cooling fan system with a design total mechanical cooling capacity over 54,000 BTU/hr. shall include either:

- An air economizer capable of modulating outside-air and return-air dampers to supply 100 percent of the design supply air quantity as outside-air;
- or
- B. A water economizer capable of providing 100 percent of the expected system cooling load as calculated in accordance with a method approved by the Commission, at outside air temperatures of 50°F dry-bulb/45°F wet-bulb and below. (with some exceptions, 140.4(e)1)

EXCEPTION 4 to Section 140.4(d): Zones in which specific humidity levels are required to satisfy exempt process loads.

Computer Rooms or other spaces where the only process load is from IT equipment may not use this exception.

									DEER2014	<u>11,484</u>

# **Boiler Systems**

This section reviews examples of the types of boiler technology that is eligible for a rebate.

### Boiler Technologies

- Steam boilers
- Heating hot water boilers
- Domestic hot water boilers
- Condensing boilers
- Boiler economizers
- Temperature lockout
- Temperature resets

### **Boiler Measures**

Below are examples of boiler measures which are eligible for a <u>rebate</u>.

- One for one replacement
- New hot water reset
- Matching boiler system

### Custom Boiler Measures

- Existing system redesign
- Removal of the heat exchanger and/or decoupling system.

### **Energy Savings Evaluation Tools**

The tools used by the utility to evaluate the savings are located on the company website, which include:

• Energy Efficiency Business Rebate List.

http://www.sdge.com/rebates-finder/earn-rebates-your-improvements

• Remote Ex-Anti Database Interface (READI) Tool

http://www.deeresources.com/

- Click on Login Form:
  - o Username: DEER
  - o Password: 2008

### • Custom Calculation Tool

http://www.aesc-inc.com/download/spc/

• eQUEST – Quick Energy Simulation Tool

http://doe2.com/equest/index.html

• Spreadsheet Calculation – A spreadsheet format, which allows the user to include the raw data.

### References

Below is a list of references to assist the user:

- New Title 24 Code, 2013 Summary of Non-Residential Building Energy Efficiencies: Database for Energy Efficient Resources (DEER)
- Energy Efficiency Business Incentives
- Local climate zones for California
- Seminar Reference Guide

# **Rebates or Incentives**

How do you choose between a rebate and an incentive? Some measures have been mandated through the California Public Utilities Commission. The order states that the <u>utility must push everything as a rebate if it has been identified</u> <u>as a deemed measure on the EEBR list</u>. Measures not included on the EEBR list can be processed through a custom program and possibly be incentivized.

• Rebate Measure on EEBR list – Mandatory

These changes allow for greater efficiencies through the process.

- Streamline application process
- Funds may be reserved up to 45 days
- Energy Star Portfolio Manager Benchmark Report
- Pre or post installation inspections may or may not be required
- Equipment Installation Easier
- Proof of Purchase
- Payment Release
- Rebate checks mailed within 30-45 days
- No Calculations Tools required
- No Measurement and Verification

Complete the application online and notify the utility that the installation has been completed. A check is cut and mailed – Process completed!

# Water Heating Measures – Example:

Looking at a condensed version of the water heating measures, the rebate list below, highlights Solution, Product Code, Description, and \$/Mbtuh - Incentive per energy use.

The example shows a storage water heater is \$2.00 per thousand BTU. Instantaneous water heater is \$2.00 per thousand BTU greater than 200 thousand BTU, and Direct Contact water heaters for both small and large are \$2.00 per thousand BTUs.

Solution	Product Code	Description	\$/Mbtuh
Storage Water Heater	G-A1	Storage Water Heater	\$2.00
Space Heating	G-B1 G-B2 G-B3	Space Heating Boiler (Stm) Space Heating Boiler (Sm) Space Heating Boiler (Lg)	\$0.25 \$0.25 \$0.50
Commercial Boiler	G-C1	Commercial	\$0.50
Instantaneous Water Heater	G-D1 G-D2	Small (>200MBtuh) Large (<200MBtuh)	\$2.00 \$0.50
Process Boiler	G-E1 G-E2	Steam Water	\$0.50
Direct Contact Water Heater	G-G1 G-G2	Small (>300MBtuh) Large (<300MBtuh)	\$2.00

# DEER to DEEMED Rebate Table

Locate the rebate table DEER to DEEMED Rebate Table in the Appendix. This new list identifies measures that were incentives in the past and are now quantified as a rebate. The list is also available on the utility website:

http://www.sdge.com/rebates-finder/save-energy-earn-incentives

This provides user with quick access to the READI measures. Users can see descriptions and the rebate per dollar amount.

# **Tools for Incentives**

What tools does the utility use for incentives? This is dependent on the Scope of Work (SOW) for the Project.

Complete a site visit.

Questions to consider:

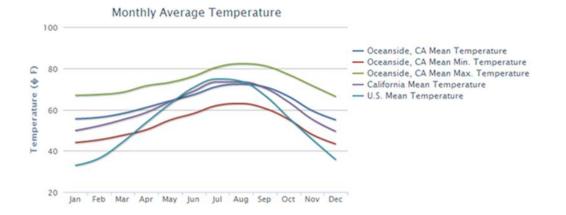

- Is this one for one replacement?
- Is it an upgrade to a backup or lead boiler?
- Are there multiple system types?
  - Is it a steam hot water, domestic hot water
- Is it multiple or increased capacity?
- Is it a retrofit add-on or modification

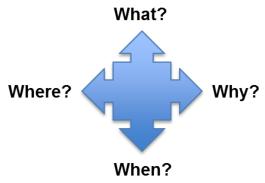

Engineering needs to collect this data in order to begin the analysis.

# **Key Data Collection**

- Hours of Operation
- Climate Zone / Zip code
- Building Type, Vintage, and Conditioned Area (sq. ft.)
- Operating Conditions baseline vs post installation (EWT, LWT, gpm, resets, etc.)
- New Boiler Type, MBH input/output, Efficiency
- Boiler Operation- Lead-Lag? Shared Load? Age?

For Custom Operation - load factor schedule and capacity

# Heating Hot Water (HHW) Boiler Example (EEBR)

Building and Equipment Characteristics::

- Large Office located in 92058
- Vintage of building is pre **1990**
- Existing Boiler: Manufacturer A WNG2500 HHW BOILER
- Proposed Boiler: Manufacturer R MVB-H7-2003 (non-condensing); 1999-MBH; efficiency = 87%
- Retrofit Add-on (REA): Direct Digital Controls System for OSA lockout, boiler reset schedule. {Rebate –EEBR}
- DEER EUL = 20 years; Title 24 = 80%

# Energy Efficiency Business Rebate (EEBR) to Energy Efficiency Business Incentive (EEBI) Comparison

How does the rebate compare to the incentive?

### Rebate Calculation

For a new space heating boiler the rebate is calculated based on the code and dollar per unit, using the formula below:

- Product code: G-B3
- Units in MBH = 1999
- \$/MBH = \$.50

Calculation for Rebate: (# Units in MBH)  $\left(\frac{\$}{MBH}\right) = \text{rebate}$ 

New Space Heating Boiler: (2000)  $(\frac{\$.50}{MBH}) = \$1000$ 

READI Measure Hot Water Reset- D03-045

- Product Code: DM-03
- Units = per controller

Calculation for Rebate = (\$681/unit) (1 controller) = **\$681** 

Total rebate would be **\$1681** 

Mandates from the California Public Utilities Commission are the primary reason why the utility is required to choose a rebate over an incentive. If the commission has deemed the product on the list, the utility is required to verify the technology against the list. Secondary reasons why the utility would chose a rebate versus an incentive would be

- Manufactures equipment specifications cut-sheet
- Sequence of Operations
- Engineer of Record and or Trade Professional Contractor
- SDG&E Pre & Post Inspections (Mandatory)
- Measurement and Verification Plan (may be required)
- Installation must be completed within Program Year (refer to website)
- Custom Calculations require SDG&E Engineering and/or CPUC review
- Processing delays
- Post M&V SDG&E review
- Must notify SDG&E of equipment or design changes

In many cases, customers have received larger rebates compared to an incentive. In addition, the process is streamlined and funds are paid out in less time.

# Fan VSDs – AHUs

All HVAC fans are eligible for the program up to a maximum of 100hp for each unit. This is an Energy Efficiency Business Rebate (EEBR) program pays directly for \$/HP. The program's order of evaluation –

- 1. Rebate
- 2. READI
- 3. CCT

VSD for HVAC Fans – Rebates

This measure is a rebated program for fan applications with VSD's used on supply, return, and exhaust systems. The maximum size would be 100hp and it is eligible only if the existing throttling devices are either removed or permanently disabled. The current rebate is \$110 per horsepower must be an SDG&E customer for new equipment only installed and operational prior to the application.

### VSD for HVAC Fans – Incentives

All HVAC fans with each fan over 100HP are eligible for the Energy Efficiency Business Incentive (EEBI). The program requires a completed application with estimated savings. These would be for HVAC supply, return, and exhaust systems and in this case it would be for larger than 100hp motors. Eligible only if the throttling devices are removed or permanently disabled. Incentives are available for replaced or failed VSDs, providing the failed VSD has not been paid within the previous five years. The current incentive rate is \$0.08 per kilowatt hour saved and \$150 per kW saved.

# Supply Fan VSD Example - BOA Tool

# Air Handler with Inlet Guide Vanes and 15HP motor

Baseline Project Bu	ilding Characteristics						
Air distribution system	VFD						
These inputs are for use in determining tool appli	These inputs are for use in determining tool applicability, and do not impact the savings calculations.						
If baseline project building characteristics do not match	If baseline project building characteristics do not match tool applicability, contact your utility program administrator.						
In	puts						
Building Type	Office						
CA Climate Zone	e 7						
Year Building Constructed	1997						
Baseline IGV Position	100% Fixed Air						
Affected Fan Motor HP	15						
Annual Fan Operating Hours	6,155						
Savings	Outputs						
Annual Electric Savings	14,982 kWh/yr 1.7% % of Annual Use						
DEER Peak Electric Demand Savings							
Warnings and Errors:	No warnings or errors exist for this measure						

Using the BOA Tools, the utility looks at a supply fan VSD on an air handler that has an existing inlet guide vane and is a 15 HP motor, and verify the calculations and compare the results to determine between a rebate and an incentive.

The engineers enter the necessary data to come up with the energy savings. In the example above, the annual electric savings is calculated at 14,982 kWh per year and a reduction in the demand of 2.4 KW.

# Supply Fan VSD Example – CCT Tool

Ten CCT2013 - Project Year 2013			- • · ×						
VAV Retrofit or VSD Supply Fan Motors (Engage) ESC Sponsor Energy Savings Calculator									
Measure Energy Savings, Runtime Hours & Incentive									
Demand	& Energy Savings E	stimate							
	kW	kWh/yr	Therm/yr						
Code/ISP Baseline Energy Usage	268.0	582,870	15,178						
Proposed Measure Energy Usage	264.0	568,623	15,189						
2nd Baseline Energy Savings	4.0	14,247	0						
S	ystem Runtime ricer								
Annual Operating Hours	Existing 0	Proposed							
	Incentive								
Incentive (@ \$0.08/kWh, \$1/Therm)	\$1,139.76	\$0.00							
Peak Demand Incentive (@ \$100/kW)	\$400.00								
Estimated Incentive Total	\$1,139.76								
Home	Help	<< Back	Next >> Finish						

CCT = 14,247kWh saved, and 4.0 kW reduced

When the CCT tool is used, the savings is similar. A total energy savings of 14,247 kWh saved is calculated. For reduced demand of kilowatts, these two tools use slightly different calculation methods but have a similar output.

### Supply Fan VSD Example – Rebate or Incentive

Comparing the results on whether to take a rebate or an incentive, the example above is a prime example of where the rebate is a better choice.

The rebate is calculated using the formula of 15HP multiplied by \$110, which would award a rebate of \$1650.00 with minimal effort. The customer contacts the utility to notify the department that the unit has been installed. Once the utility verifies the installation, a request is submitted to process a rebate check.

Using a customized tool for an incentive would require added time and paperwork to complete the process and rendering a smaller \$1500.00 incentive. The incentive process requires a pre-inspection and a post-inspection. It is obvious in this case that a rebate is not a penalty and is it is a better choice.

Note: This is an example. Recall, 15HP motor must be a rebate item (less than 100HP) and cannot be an incentive measure.

Page purposely left blank

# **Pumps with VSDs**

Section provides information about energy efficiency measures when adding Variable Speed Drives (VSDs) on chilled water pumps, hot water loop pumps, circulating water pumps, condenser water pumps. Booster pumps for domestic hot water systems and other application processes will also be discussed. Dual baseline considerations will also be highlighted.

These types of projects will require a pre-

### installation inspection.

# VSDs on Circulating Water Pumps (WSHPs):

Circulating water pumps for water source heat pump (WSHP) projects can yield between 10% to 60% energy savings. However, the average savings is usually

estimated at 30% of the baseline kilowatt hours. These percentages are verified after installation. Prior to installation, the utility needs data which is located on the motor nameplate:

- HP Horsepower (Goldenrod)
- PF Power factor (Purple)
- Efficiency (Green)
- FLA Full Loan amps (Red)
- PH Phase (Blue)

Additional measured data that is needed

- Amps
- Voltage

The engineers will also need:

- How many pumps
- How the pumps operate together (Are there lead lags and whether either one is on a standby.)

V		TOUGH		3600	G1 P0

# VSDs on Circulating Water Pumps (WSHPs) – Example

In this example, the baseline kilowatt hours, which is equal to the kW of the pump times the operating hours annual operating hours.

Calculate Baseline kWh  $\rightarrow$  kWh = kW\*(operating hours)

Calculating kW = *Amps* multiplied by *Volts*, multiplied by *Power factor*, *multiplied by* square root of *Phase*, divided by the conversion factor will be equal to *Horsepower* multiplied by its *Conversion*, multiplied by *Load factor* divided by the *Efficiency*.

For a slip load calculation, the load factor is calculated at 60%, which is multiplied by the 25HP motor, which renders 15HP. Then taking the identified *Poles*, plug the integer in the equation to calculate the free kilowatt hour savings.

$$kW = \frac{\left(Amps * Volts * PF * \sqrt{PH}\right)}{1000 W/kW} = hp (.7457) \left(\frac{LF}{Eff}\right)$$

<b>LF</b> = Load Factor = Ratio of operating RPM, Amps, BHP/Rated RPM, Amps, or HP	)
--	---

Example: Slip Load Calculation	Poles	60 Hertz	
Given: Synchronous speed in rpm = 1800	2	3600	
Nameplate full load speed = 1750 Measured speed in rpm = 1770	4	1800	
Nameplate rated horsepower = 25 hp	6	1200	
Determine actual output horsepower.	$Load = \frac{I}{I_r} x \frac{V}{V_r} x 100\%$		
From Equation 5	Where: Load = Output power as a % of rated power I = RMS current, mean of 3 phases I <sub>r</sub> = Nameplate rated current		
$Load = \frac{1800 - 1770}{1800 - 1750} \ge 100\% = 60\%$			
Actual output horsepower would be $60\% x 25 \text{ hp} = 15 \text{ hp}$	V = RMS voltage, mean line-to-line of 3 phases V <sub>r</sub> = Nameplate rated voltage		

## Alternative Estimation Approach: BIN Analysis

Using a BIN Analysis, the utility can use an alternative estimation approach going into the project, pre-installation. The utility assigns operating frequencies to various temperature ranges based on minimum and maximum current in these percentages. The engineers determine the annual hours that the pumps will be running in each temperature range and use standard TMY3 Data.

# **Note:** TMY3 data is available at various websites - DOE Energy Plus Website (reference manual)

Then we can calculate a new brake horsepower using the pump affinity laws. The new kW equals the full load kW multiplied by a frequency reduction raised to an exponent. This exponent is normally *three* in the engineering books and in theory. However, in application, what has been seen and measured is often different. Therefore, the Public Utilities Commission has approved an alternative calculation method that the utility has adopted.

*Calculate the new BHP (kW) using pump affinity laws* 

$$kW_{new} = \frac{kW_{full} * \left(\frac{frequency}{60}\right)^{2.4}}{eff_{VFD}}$$

	04 (٩		VSD Frequency (HZ) Min = 35	Total BIN Hours
88		90	60	1
86	-	88	60	15
84	-	86	60	12
82	-	84	60	27
80	-	82	60	33
78	-	80	56.9	45
76	-	78	53.8	93
74	-	76	50.6	182
72	-	74	47.5	239
70	-	72	44.4	374
68	-	70	41.3	527
66	-	68	38.1	691
64	-	66	35	671
62	-	64	35	598
60	-	62	35	577
58	-	60	35	687
56	-	58	38.6	498

40	-	42	60	7
38	-	40	60	7
36	-	38	60	1
			Fiai	ire 1

Figure 1

**Note:** The 2.4 is a conservative exponent. The savings will be verified with post-installation. Measurement and Verification (M&V).

	PUMP LA	W
(kW1 / kW2)	=	(gpm1 / gpm2)^n
kW	=	pump power
gpm	=	gallons per minute
n	=	3 (ideal conditions)

Pump	Affinity	Law	Applied:	(real	world /	non	ideal)	

FAN LAW(kW1 / kW2)=(cfm1 / cfm2)^nkW=fan powercfm=cubic feet per minuten=3(ideal conditions)

The applied Pump Affinity Law in the real world is not an ideal application. The above chart would apply to chilled water pumping and IT cooling systems where the geometry is fixed in a fully or mostly closed application.

"n" FOR AIR / WATER LOOPS					
	Fully or Mostly Closed	Semi-Closed	Mostly or Fully Open		
Fixed Geometry:	2.4	2.2	2.0		

In a semi-closed application, this would apply to a condenser water loop for open cooling tower and CRAC/CRAH units for hot/cold aisles.

In mostly or fully open applications, this would apply to unobstructed underfloor plenum or an open return system and you have to use these exponents in the pump affinity calculation.

# Post-Installation: Verify estimated savings

Calculating estimated savings post-installation will require the placement of data loggers to capture any nonstandard changes. The data loggers remain on the units for a minimum of four weeks. The engineering group will then identify the best two week data, and then eliminate some of the anomalies in the data set.

**Operating Amps and OAT** 

# Calculate Post-installation kW and kWh similarly

$$kW = \frac{(Amps * Volts * PF * \sqrt{PH})}{1000 W/kW}$$

## Note: kWh – Average the kW in each OAT bin

By measuring the outside air temperature as well as the *operating amps*, the calculation of the post-installation kilowatts and kilowatt hours can be completed using the above formula. Using the average kilowatts in each temperature BIN (See Figure 1-previous page), the utility can extrapolate data annually using the TMY3 temperature data.

### Calculated Energy Savings

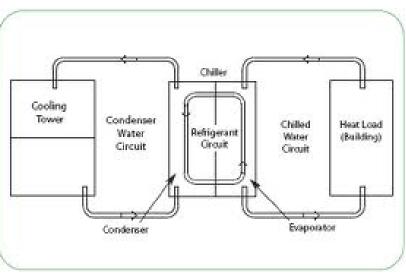

Annual Savings are calculated by taking the pre-installation kilowatt hours minus the post-installation kilowatt hours.

Then the kilowatt reduction in demand would be calculated from the established DEER peak hours of 2:00 PM – 5:00 PM on September  $1^{st}$ ,  $2^{nd}$ , and  $3^{rd}$ .

# **VSDs on Condenser Water Pumps**

Condenser water pump projects will require a Measurement & Verification (M&V). One month of pre-measured data and one month of post-measured data on the whole system is required.

Chiller consumption needs to be considered because the water circuits on both sides will affect the performance of the chiller. Reduced flow rates will take place, which affects the pressure and the operating efficiency. Pumping energy will be reduced, and additionally, the chiller will require less energy too. The utility is

looking to capture that savings along with the pump energy savings.

# **VSDs on Process Pumps**

Energy Savings for Process Pumps would be independent of outside air temperature, so a different method is used for estimating these savings.

Item	Value	Comment	
Total Pumping Horsepower (hp)	250.00		
Average Pump Load Factor	85%		
Pump Motor Efficiency	92%		
Total Pump Operating Hours	8,760	Obtain from EMCS, site personell, or operating logs.	
% Hours Operating at 100% Load	10%		
% Hours Operating at 90% Load	20%		
% Hours Operating at 80% Load	50%		
% Hours Operating at 70% Load	20%	$kWh = (70\%)^{2.5} * 8760 * 20\%$	
% Hours Operating at 60% Load	0%		
% Hours Operating at 50% Load	0%		
% Hours Operating at 40% Load	0%		
% Hours Operating at 30% Load	0%		
Sum of % Hours Operating at Various Loads	100%	Should always equal 100%	
Electric Cost (\$/kWh)	0.13	Total Consumption Cost (\$) / Total Consumption (kWh)	
Pre-Retrofit Energy Consumption (kWh)	1,509,433.70	HP * 0.7457 * LF / EFF * HOURS	
Post-Retrofit Energy Consumption (kWh)	938,710.90	Sum of kWh @ 100% - 30%	

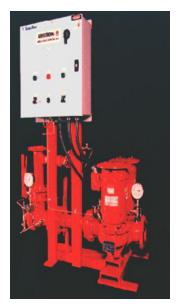

The spreadsheet above shows the pumping horsepower on operating conditions where the load is 100%, 90%, 80%, 70%, etc. The value for estimated time of operation is 10% at the 100% load, 20% at the 90% load, 50% at the 80% load, etc. The conditions are applied as well as the pump information. In this example, the 250HP pump would calculate a savings and a consumption drop of pre-installation kWh and post-installation kWh to provide a 500,000 kWh savings.

# VSDs/Booster Pumps on Domestic Water

Booster pumps on domestic water require M&V with a four week measured baseline kW. The constant flow hours of operation are reviewed as well as the monitoring of postinstallation consumption.

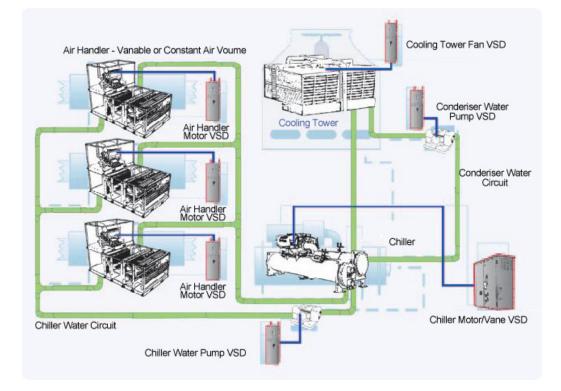

Additional documentation of occupant behavior and/or schedules may be required for these projects; allowing the utility to extrapolate the annual use and savings.

Typically, the schedules vary on a daily basis, but not seasonally.

## **Dual Baseline Considerations**

Dual baseline considerations would be for the VSD effective useful life (EUL). Retrofit add-ons, would have no dual baseline requirement. However, the useful life for a VSD is 15 years with various applications on the chilled water system.

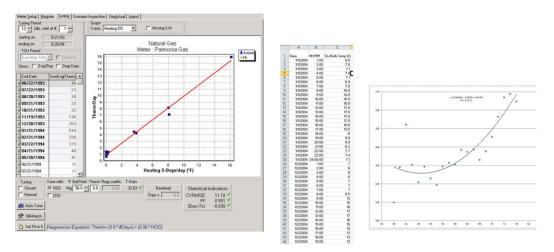

In reality, pump life is dependent on water quality and will be compared to maintenance records to determine the frequency of pump repair and actual operating life.

Page purposely left blank

# Measurement & Verification (M&V)

Measurement and Verification (M&V) is performed on projects that are proposed at greater than 20% higher than deemed and/or DEER savings.

## Collection Information:

The utility will require the following information for all M&V projects:

• Lighting Levels; Current; Power; Voltage; Temperature; Nameplate data

Time frame for completion of these projects is dependent on the complexity. The data requires a range of two weeks up to four weeks. More complex, whole building approach will require:

- Full year data (12 months for 10%bonus in incentive dollars)
- 15-Minute Intervals is sufficient

## Sources:

Customer or Sponsor can supply information and data from the building EMS. The utility can provide HOBO data loggers and the customer can install them on the equipment. The utility will also review the Monthly Billing Data, which is recorded by the meter.

## Limits:

To perform M&V projects the project must be a minimum of 50,000 kWh savings or requested by utility engineers or CPUC staff.

If the limits to this approach are less than that of an incentive, the cost benefit is not justifiable to use this method.

California utilities	Pacific Gas and Electric Company ( <b>PG&amp;E</b> ), Southern California Edison Company ( <b>SCE</b> ), Southern California Gas Company ( <b>SoCal Gas</b> ), San Diego Gas and Electric ( <b>SDG&amp;E</b> ), and the Sacramento Municipal Utility District ( <b>SMUD</b> ).				
ССТ	Customized Calculation Tool (2013) used with the SDG&E Incentive Program. Download at: <u>http://www.aesc-inc.com/download/spc/</u>				
	Download at. <u>mip://www.aesc-inc.com/download/spc/</u>				
CEC	California Energy Commission				
CFL	Compact Fluorescent Light				
CHW	Chilled Water				
CW	Condenser Water				
Climate Zone	California Climate Zone weather data set for weather related measures. The Climate Zone list is from the California Energy Commissions (CEC) website: <u>http://www.energy.ca.gov/maps/renewable/building_climate_zones.html</u>				
Closed loop	A cooling water system with cooling water closed to the atmosphere. Closed loop systems generally do not require pumping against a fixed static head				
СМРА	Custom Measure Project Archive				
CPUC	California Public Utilities Commission. Governmental panel of 5 commissioners appointed by the Governor for 6 yr. terms.				
CRAC /CRAH	Computer Room Air-Conditioner/ Computer Room Air Handler				
СТ	Current Transformer, or Cooling Tower				
Data Center	Energy Efficiency Baselines for Data Centers available at: <u>http://www.pge.com/includes/docs/pdfs/mybusiness/energysavingsrebates/incentivesbyindustry/</u> <u>hightech/data_center_baseline.pdf</u>				
Deemed	"Deemed" incentives have a predetermined agreed upon amount of savings (per energy unit). Rebate programs and DEER provided Deemed savings				
DEER	Database for Energy Efficient Resources a California Energy Commission and California Public Utilities Commission (CPUC) sponsored database designed to provide well-documented estimates of energy and peak demand savings values, measure costs, and effective useful life (EUL) all within one data source.				

DOE	U.S. Department of Energy. DOE sponsored building energy software tools for download: <u>http://apps1.eere.energy.gov/buildings/tools_directory/doe_sponsored.cfm</u>				
DRP	<b>Demand Response Program</b> . Program to reward/influence customers to reduce their consumption during peak hours. This may or may not result in overall reduction in consumption – Objective is to use less during peak periods.				
DSM	Demand Side Management				
	The first baseline in a dual-baseline project uses the existing equipment parameters to determine the baseline energy usage. Savings calculated using this baseline are eligible throughout the RUL of the existing equipment.				
Dual Baselines	The second baseline uses industry standard practice (ISP) or building code standards to determine the baseline energy usage, because this baseline represents the period of time that is beyond the existing equipment's EUL. Savings calculated using this baseline are eligible for the time period beyond the RUL of the existing equipment, through the EUL of the proposed equipment.				
EAR	Ex Ante Review				
ECM	Energy Conservation Measure				
ED	Energy Division ( a division of the California Public Utilities Commission)				
EE	Energy Efficiency				
EEBI	<b>Energy Efficiency Business Incentive</b> , The SDG&E version of the Statewide Customized Offering. The 2013 Statewide Customized Offering provides financial incentives for the installation of high-efficiency equipment or systems.				
EEBR	<b>Energy Efficiency Business Rebate</b> , The SDG&E version of the Statewide Customized Offering. Provides rebates to eligible business customers for installing energy-efficient lighting, refrigeration, food service, natural gas, and other technologies.				
EEGA	<b>Energy Efficiency Groupware Application</b> , Consolidated public repository of California Investor Owned Utility (IOU) submitted reports on energy efficiency (EE) programs and savings achievements. Website: <u>http://eega.cpuc.ca.gov/</u>				
EMS	Energy Management System				
EM&V	Evaluation, Measurement, and Verification				
EE Measurement Wizard	A building modeling option used in the eQUEST, Quick Energy Simulation Tool.				

eQuest	eQUEST-the QUick Energy Simulation Tool. Download at: <u>http://www.doe2.com/equest/</u>				
EUL	<b>Effective Useful Life</b> is an estimate of the median number of years that a piece of equipment will function cost-effectively (without prohibitively expensive maintenance costs and frequent breakdowns). For estimating energy savings, the PUC has developed a list of EUL's in the DEER database, used by the READI tool.				
Ex-Ante	Expected savings based upon calculations, before installation.				
Ex-Post	Actual savings based upon measurements, following installation.				
HHW	Heating Hot Water				
HVAC	Heating, Ventilating, and Air Conditioning				
Incremental Cost	The differential cost between full measure cost and Code or Industry Standard Practice cost.				
IDSM	Integrated Demand Side Management				
IOU	Investor Owned Utility				
IR	Installation Report				
ISP	Industry Standard Practice				
kW	Kilowatt; rate of energy flow per unit time (1000 Joules per second, 3415 BTU's per hour)				
kWh	Kilowatt hour; unit of energy (3600 kilojoules, 3412 BTU's)				
LabPro	A laboratory airflow system modeling software provided by Phoenix Controls Corporation, see: <u>http://www.newmatic.net/resources/pdf/energysavings/LabPro-User-Manual-and-Appendix.pdf</u>				
LED	Light Emitting Diode				
Lighting Tool	<b>2013 Calculated Lighting Equipment Survey Table</b> is an interactive excel spreadsheet tool for calculating existing lighting LPD's, 1 <sup>st</sup> and 2 <sup>nd</sup> baselines, and estimated energy savings. Download at: <u>http://www.SDGE.com/rebates-finder/save-energy-earn-incentives</u>				
LPD	Lighting Power Density, LPD values for various building applications can be found in current California Title 24 Code (watts per square foot).				
Lumens	Amount of light produced by a lamp (bulb), the "brightness" level.				

M&V	<b>Measurement And Verification</b> , The calculation approach for some EE projects requires baseline and/or post-retrofit measurement and verification (M&V) to confirm the energy savings. The M&V requirements vary widely depending on the size and type of a project. Projects with variable loads generally require more measurement and verification than constant-load projects.				
M&V Option B	<b>International Performance Measurement and Verification Protocol Option B</b> –Savings are determined by measuring energy use of the systems to which the ECM was applied, separate from the energy use of the rest of the facility. Short-term or continuous measurements are taken through the post-retrofit period.				
M&V Option C	International Performance Measurement and Verification Protocol Option C- Savings are determined by measuring energy use at the whole facility level. Short-term or continuous measurements are taken throughout the post-retrofit period.				
MBCx	Monitoring Based Commissioning				
Measure	A capital investment that reduces energy cost in an amount sufficient to recover the total cost of purchasing and installing such a measure. May also qualify for a rebate or incentive through SDG&E's customer programs.				
Measure Life	See EUL and RUL				
Motor-Master	<b>MotorMaster+</b> is a free online software tool that helps users to analyze energy use and savings opportunities in systems. Download at: <u>http://www1.eere.energy.gov/manufacturing/tech_assistance/software_motormaster.html</u>				
NTG	<b>Net To Gross</b> - The ratio or percentage of net program impacts divided by the gross or total impacts. NTG is used to estimate and describe the free- ridership that may be occurring within efficiency programs.				
Open loop	A cooling water system with cooling water exposed to the atmosphere. Open loop systems generally require pumping against a fixed static head.				
OBF	On Bill Financing - Program to finance "zero" interest loans to customers who install replacement energy efficient equipment. See website: <u>http://www.SDGE.com/business/bill-financing</u>				
OR	Operating Report				
PA	Program Assistant				
PUC	California Public Utilities Commission (also CPUC)				
RCx	Retrocomissioning. See program website: <u>http://www.sandiegorcx.com/</u>				

	Remote Ex-Ante Database Interface Download <u>READI (Version 2.0.1)</u> at:			
READI	http://www.deeresources.com/index.php/deer2013-update-for-2014-codes			
	All of the DEER2013 Unit Energy Savings (UES) values and measure data are stored on a remote database server. A database access tool has been developed that provides live access to the database. The tool, READI (Remote Ex-Ante Database Interface) connects to the database over the internet utilizing a secure and encrypted connection over port 22 or a standard remote database connection over port 5432. The program allows users to view and download all of the data associated with the DEER2013, DEER2013 Alternate and DEER2011 databases. The program allows users to view and download any of the data associated with the DEER2013 update, in a CSV file format.			
Rebuild	Equipment that has received major service or reconditioning.			
ROB	<b>Replace on Burnout</b> - category includes retrofits where the existing equipment is either non- functional or has less than one year of RUL. The energy savings for ROB measures are calculated as the difference in energy use between the high-efficiency equipment and the standard-efficiency equipment that would have been purchased without program intervention.			
RET	Retrofit, Replacing equipment that still has at least one year of remaining useful life (RUL)			
Retrofit/ Add- ons	Retrofit/Add-on measures typically involve adding equipment or controls on to existing equipment in order to save energy. Typically, a building owner is not compelled to install new controls in order to comply with code. Therefore, REA energy savings are typically calculated as the difference between the proposed system's energy consumption and the existing system's consumption.			
RUL	<b>Remaining Useful Life</b> of a piece of equipment is the estimated remaining time that a given piece of equipment will operate cost-effectively. If the exact equipment vintage is known, as in the example above, then the RUL is calculated as the difference between the EUL and the equipment's age. Otherwise, it is estimated to be 1/3 of the EUL.			
Smart Controls	Smart controls provide comprehensive integrated control of electric or natural gas end uses to minimize overall system energy consumption. Smart controls employ algorithms and control sequences to optimize (minimize) energy consumption. In addition, smart controls may employ algorithms and control sequences to automatically regulate energy systems in response to demand response events.			
SPC	Standard Performance Contract (expired program, rolled into EEBR/EEBI)			
Space Types	Generally, building types listed in DEER			
Title 20	2012 California Appliance Efficiency Regulations, Section 1601 et seq. Download at: <u>http://www.energy.ca.gov/appliances/</u>			

Title 24	2013 California Building Energy Efficiency Standards, Part 6. Download at: <u>http://www.energy.ca.gov/title24/2013standards/index.html</u>				
ТМҮЗ	Typical Meteorological Year Weather Data, (TMY3) data sets derived from the 1991-2005           National Solar Radiation Data Base (NSRDB) archives, Download at: <u>http://doe2.com/Download/Weather/TMY3/</u>				
TOU	Time Of Use rate structure.				
TRAV	<b>Terminal Regulated Air Volume</b> (TRAV) is an HVAC and lighting control strategy that has been made possible with the introduction of high- performance full-DDC systems, developed by Thomas Hartman. See: <u>http://www.hartmanco.com/pdf/p02.pdf</u>				
UES	Unit Energy Savings - UES values are the annual savings associated with a specific measure Savings include annual total electric savings in kWh, annual total gas savings in therms and per period demand reduction in kW. Savings are expressed in terms of a "common unit" such as; tons of cooling capacity; a single appliance such as a clothes washer; a single dwelling unit such as a single family home or individual apartment; square foot of conditioned floor area; lighting fixture or lamp.				
VFD/ VSD	Variable Frequency Drive/ Variable Speed Drive – used interchangeably.				
Vintage	The age of a facility or equipment.				
Whole Building Method	Energy saving analysis method that uses Whole Building Modeling calibrated to annual electric bills.				
Work Paper	A Work Paper is a living engineering document that provides comprehensive information and calculations on energy efficiency measures commonly installed in the residential and /or nonresidential market segments. The document contains a description of the measure under consideration, as well as its delivery mechanism, and baseline data. It also gives an explanation and reasoning behind using a specific calculation method that differs from the Database of Energy Efficiency Resources (DEER). A work paper serves as a starting point in the planning and forecasting of the impacts and cost-benefit analysis of energy efficiency and demand response programs.				
WSHP	Water Source Heat Pump				
Qualified Lighting Products	Commercial Lighting Qualifying Products List. Available at: <u>http://library.cee1.org/content/commercial-lighting-qualifying-products-lists</u>

# Appendix

## **Energy Efficiency Business Incentives Program Checklist**

# Energy Efficiency Business Incentives Program Checklist

Sempra Energy utility

## 1 STARTING POINT FOR ALL SUBMITTALS

- Submit Completed Application (Forms 1, 2, 3)
- Submit Completed IRS Form W-9 (if you have not already submitted this form for our records)

- Submit Manufacturer Specification Sheets
- Trade Professional Agreement

#### DEFINE THE TOTAL PROJECT COSTS FOR NEW EQUIPMENT

Include quantity, materials, labor, and other pertinent information

#### DEFINE THE ANNUAL ENERGY USAGE FOR NEW EQUIPMENT\*

- Define the efficiency, run hours, load factor, horsepower, tons, or any other pertinent equipment information
- Calculate the total kW, kWh and/or therms that each piece of equipment will consume annually
- Provide calculation tools

#### **DEFINE ANNUAL ENERGY USAGE FOR THE EXISTING EQUIPMENT\*** • Define the efficiency, run hours, load factor, horsepower, tons, or any

\* If lighting is included the 2013 Calculated Lighting Equipment Survey Table is required

- Calculate total kW, kWh and/or therms that each piece of equipment consumes annually
- Provide calculation tools

# **2** REPLACE ON BURN OUT

other pertinent equipment information

Projects Must Fulfill Items Listed Below and Section 1

DEFINE EFFECTIVE USEFUL LIFE OF NEW EQUIPMENT

Information can be located on manufacturer specification sheets

- DEFINE THE ANNUAL ENERGY USAGE USING MINIMUM CODE OR INDUSTRY STANDARD PRACTICE (ISP)
- Provide Title 24 minimum code efficiencies or the industry standard efficiencies for the equipment in question

## EARLY RETIREMENT PROJECTS

Projects Must Fulfill Items Listed Below and Section 1 & 2

#### DOCUMENT INSTALL DATE OF EXISTING EQUIPMENT

 Include invoices, receipts, and any other pertinent information; commissioning documents; contact equipment manufacturer with serial number to verify a sale year

#### DEFINE EFFECTIVE USEFUL LIFE OF EXISTING EQUIPMENT

Refer to the manufacturer specification sheet; use the install/commissioning date to define the years left for the equipment

#### PROVIDE MAINTENANCE RECORDS FOR THE EXISTING EQUIPMENT

 Include history of all service (preferably dating back to the date of purchase); HVAC maintenance companies or internal maintenance staff can provide this information

P.O. Box 129831 | San Diego, CA 92112-9831 | 1-800-411-7343 | Connect at sdge.com

## Energy Efficiency Business Rebates (EEBR) Measures Table

\*Rebate \$/Units are subject to change without notice. Refer to <u>www.sdge.com</u> for current values.

Agricultural Products					
Solution	Product Code	Production Description	Units	\$/Units	
Irrigation	0-C1	Sprinkler to Drip Irrigation	Acre	\$44.00	
Sprinkler Nozzles	0-D1	Low Pressure Sprinkler Nozzles	Nozzle	\$1.15	
Greenhouse Heat Curtain	G-K1	Greenhouse Heat Curtain - Requires Pre- inspection	Square Foot	\$0.40	
Infrared Film	G-L1	Infrared Film for Greenhouses	Square Foot	\$0.05	

Food Service Products					
Solution	Product Code	PRODUCTION DESCRIPTION	Units	\$/Units	
Steam Cooker	FS-A1	Electric	Steamer	\$1,250.00	
Steam Cooker	FS-A21	Gas	Steamer	\$2,000.00	
Insulated Holding	FS-B1	Full Size	- Unit	\$300.00	
Cabinet	FS-B2	Three Quarter Size	Unit	\$200.00	
Fruor	FS-C1	Electric Fryer (vat width less than 18 inches)	- Vat	\$200.00	
Fryer	FS-C2	Gas Fryer (vat width less than 18 inches)	Val	\$749.00	
	FS-D8	101-200 lbs. per 24 hrs. (ENERGY STAR <sup>®</sup> )		\$50.00	
	FS-D9	201-300 lbs. per 24 hrs. (ENERGY STAR)		\$50.00	
	FS-D10	301-400 lbs. per 24 hrs. (ENERGY STAR)		\$75.00	
	FS-D11	401-500 lbs. per 24 hrs. (ENERGY STAR)	Unit	\$75.00	
	FS-D12	501-1,000 lbs. per 24 hrs. (ENERGY STAR)		\$125.00	
	FS-D13	1,001-1,500 lbs. per 24 hrs. (ENERGY STAR)		\$200.00	
Ice Machine	FS-D14	Greater than 1,500 lbs. per 24 hrs. (ENERGY STAR)		\$250.00	
	FS-D15	101-200 lbs. per 24 hrs. (CEE Tier III)		\$100.00	
	FS-D16	201-300 lbs. per 24 hrs. (CEE Tier III)		\$100.00	
	FS-D17	301-400 lbs. per 24 hrs. (CEE Tier III)		\$150.00	
	FS-D18	401-500 lbs. per 24 hrs. (CEE Tier III)		\$150.00	
	FS-D19	501-1,000 lbs. per 24 hrs. (CEE Tier III)	1	\$250.00	
	FS-D20	1,001-1,500 lbs. per 24 hrs. (CEE Tier III)		\$400.00	
	FS-D21	Greater than 1,500 lbs. per 24 hrs. (CEE Tier III)		\$500.00	
Cui d -l l -	FS-E1	Electric	Cui delle	\$300.00	
Griddle	FS-E2	Gas	Griddle	\$125.00	
Combination	FS-F1	Electric		\$1,000.00	
Oven	FS-F2	Gas	0	\$750.00	
Convertion Over	FS-G1	Electric	Oven	\$350.00	
Convection Oven	FS-G2	Gas	1	\$500.00	

Solution	Product Code	PRODUCTION DESCRIPTION	Units	\$/Units
	FS-H11	Refrigerator < 15 ft3		\$65.00
Solid-Door Reach- In	FS-H21	Refrigerator 15-29 ft3		\$75.00
Refrigerator	FS-H31	Refrigerator 30-49 ft3		\$125.00
Kenngerator	FS-H41	Refrigerator 50 ft3 and over		\$200.00
Calid Deer Deeeb	FS-I11	Solid-Door Reach-In Freezer < 15 ft3		\$100.00
Solid-Door Reach- In	FS-121	Solid-Door Reach-In Freezer 15-29 ft3		\$200.00
Freezer	FS-131	Solid-Door Reach-In Freezer 30-49 ft3		\$300.00
Treezer	FS-141	Solid-Door Reach-In Freezer 50 ft3 and over	Unit	\$600.00
	FS-J51	Glass-Door Reach-In Refrigerator < 15 ft3	Unit	\$75.00
Glass-Door Reach-	FS-J61	Glass-Door Reach-In Refrigerator 15-29 ft3		\$100.00
In Refrigerator	FS-J71	Glass-Door Reach-In Refrigerator 30-49 ft3		\$125.00
Reffigerator	FS-J81	Glass-Door Reach-In Refrigerator 50 ft3		\$150.00
	FS-N11	Glass-Door Reach-In Freezer < 15 ft3		\$200.00
Glass-Door Reach- In	FS-N21	Glass-Door Reach-In Freezer 15-29 ft3		\$250.00
Freezer	FS-N31	Glass-Door Reach-In Freezer 30-49 ft3		\$500.00
Treezer	FS-N41	Glass-Door Reach-In Freezer 50 ft3 and over		\$1,000.00
Commercial Gas Rack Oven	FS-K1	Single or Double	Unit	\$2,000.00
Commercial Conveyor Oven	FS-L1	Conveyor Oven	Deck	\$750.00
Commercial Kitchen Ventilation Control	FS-M1	New Hood or Retrofit Electric	Fan HP	\$350.00

#### GENERAL REQUIREMENTS

- Customer must have a San Diego Gas & Electric<sup>®</sup> (SDG&E<sup>®</sup>) commercial, industrial or agricultural electric account
- Carefully read the specifications and definitions to determine whether you are installing a qualifying product(s)
- All equipment must be installed and operational before a rebate application is submitted
- It is the responsibility of the customer to ensure the equipment to be installed adheres to all state, local and national building codes and ordinances, as well as the manufacturer's requirements
- All rebates apply toward the purchase of new or replacement energy-efficient equipment, unless otherwise indicated. Used or rebuilt equipment is not eligible.
- All applications for DEER measures listed in this catalog must have a pre-inspection & post-inspection. To schedule your pre-inspection please call our Energy Savings Center at 1-800-644-6133

- ☑ ●LIGHTING CALCULATIONS:
- LIGHTI • California Public Utilities Commission (CPUC) Has mandated utilities to calculate current Title 24 code AS EXISTING BASE-CASE.
  - TITLE 24 INDOOR LIGHTING (ALLOWED LIGHTING POWER)
    - -2013 Building Energy Efficiency Standard

-Allowed Lighting Power (Wattage)

#### CUSTOM ENERGY SAVINGS CALCULATIONS

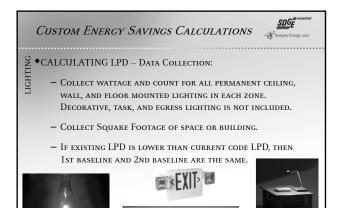

• 2013 Title 24 Update- New Mandatory Code Lighting Controls - Automatic daylighting controls in primary daylit zones

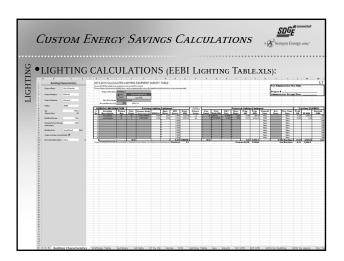

- - HOTEL/MOTEL GUEST ROOM CAPTIVE CARD OR OCCUPANCY SENSING LIGHTING CONTROLS, OCCUPANCY SENSING RECEPTACLES
  - Automated lighting controls for Multifamily and Hotel/ MOTEL CORRIDORS
  - OCCUPANCY SENSORS IN WAREHOUSES, LIBRARIES, OFFICES, CLASSROOMS, CONFERENCE ROOMS, MULTIPURPOSE ROOMS
  - Occupancy sensing lighting in parking garage spaces
  - Outdoor luminars <24 ft. -motion sensors to reduce light level

#### CUSTOM ENERGY SAVINGS CALCULATIONS

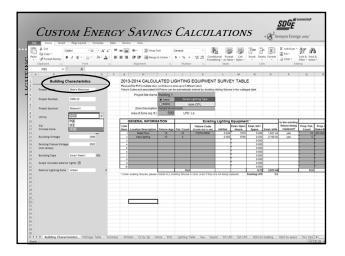

- $\stackrel{\text{O}}{\simeq}$  •LIGHTING POWER DENSITY (LPD) and DUAL BASELINE :
- •Lighting Table will calculate 2nd-baseline and LPD.
  - 1st baseline is calculated by lighting audit
    - ✤CALCULATE ACTUAL LIGHTING POWER
  - 2ND BASELINE AND LPD IS AUTOMATICALLY CALCULATED

✤Title 24 Maximum Allowed Lighting Power (LPD) ✤LPD = WATTS/SQ.FT

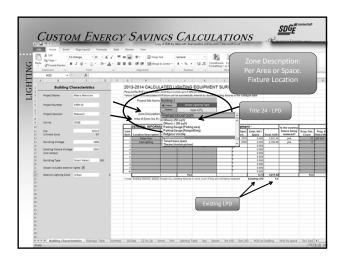

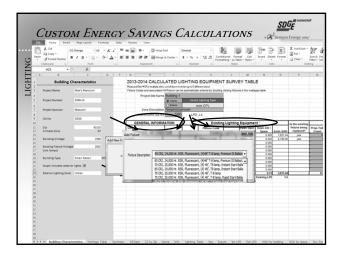

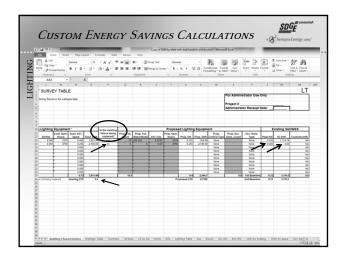

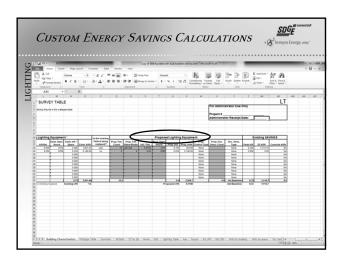

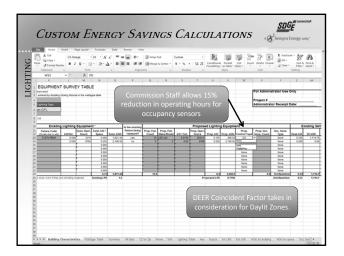

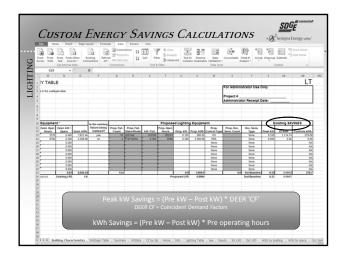

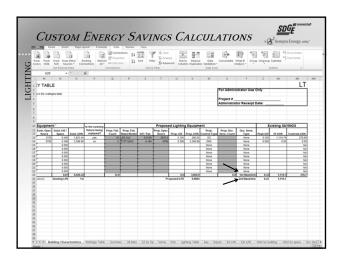

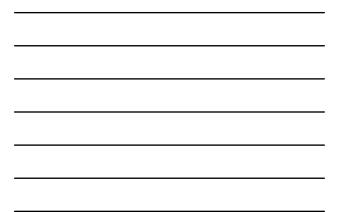

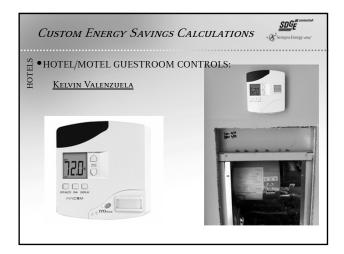

- •MEASUREMENT & VERIFICATION: M&V performed on projects that Higher than Deemed and/or DEER – M&V performed on projects that are proposed >20\%  $\,$ HIGHER THAN DEEMED AND/OR DEER SAVINGS

- M&V projects must be minimum 50,000 kWh savings
- Or requested by utility engineers or CPUC

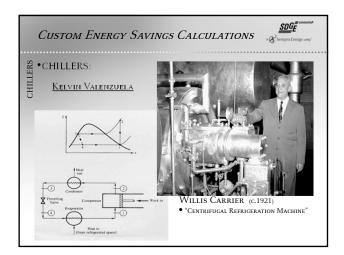

### • HOTEL GUESTROOM CONTROLS (M&V): – Used When estimated savings exceeds 50,000 kWh

- - MEASURE PERFORMANCE OF UNITS IN SELECTED ROOMS
  - Number of sample sizes is dictated based on total number of guestrooms & IPMVP STANDARDS FOR SAMPLING
  - SAMPLE NEEDS TO INCLUDE DIFFERENT ORIENTATION AND BOOKING RATES
  - From trending and Billing Data, develop specific conditions to calibrate EQUEST MODEL TO GENERATE ENERGY SAVINGS POTENTIAL
    - INCLUDE DOCUMENTATION OF ACTUAL GUESTROOM THERMOSTAT SET POINTS TO SUBSTANTIATE THE "OCCUPIED" THERMOSTAT SCHEDULE, AND
    - Verification of the installed guestroom thermostat settings, e.g. the SETBACK TEMPERATURE SET POINT FOR HEATING AND COOLING MODES.

#### CUSTOM ENERGY SAVINGS CALCULATIONS

- Section 120.2 (e)4 from 2013 Title 24: Hotel and motel guest rooms sha - Hotel and motel guest rooms shall have captive card KEY CONTROLS, OCCUPANCY SENSING CONTROLS, OR AUTOMATIC CONTROLS.
  - Activated no longer than 30 minutes after the guest ROOM HAS BEEN VACATED
  - Setpoints are:
    - Set-up at least  $+5^{\circ}F$  in cooling mode
    - Set-down at least -5° F in heating mode
  - Lighting is also switched OFF
  - IF REMAINING USEFUL LIFE (RUL) >1 ON EXISTING THERMOSTATS, CAN BE ELIGIBLE FOR INCENTIVES

## •TOOLS: - REAL

#### CUSTOM ENERGY SAVINGS CALCULATIONS

#### $\mathop{\cong}_{\scriptscriptstyle{\rm H}}$ •what tools do I use?

- •Depends on Scope of Project:
  - One for one replacement?
  - Upgrade back-up chiller to lead chiller?
  - MULTIPLE CHILLERS AT SITE?
  - Multiple Capacities / Increased Capacity
  - Modifications

#### CUSTOM ENERGY SAVINGS CALCULATIONS

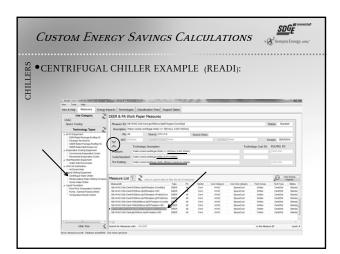

#### $\stackrel{\mathrm{Se}}{=}$ •Key Data for Collection:

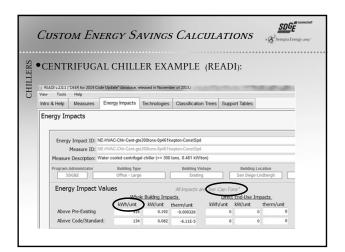

CHILL

- Building Type, Vintage, and Conditioned Area (s.f.)
  - HOURS OF OPERATION
- Climate Zone / Zip code
- Operating Conditions water temps, gpm flow, etc.
- New Chiller Type, Tons, Efficiency (KW/Ton), VSD
- Chiller Operation- Lead-Lag? Shared Load? Age?
- Additional Plant Chillers- type, capacity, OPERATION

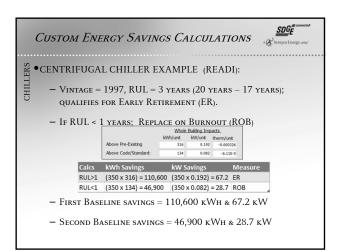

#### CUSTOM ENERGY SAVINGS CALCULATION • CENTRIFUGAL CHILLER EXAMPLE (READI): - Large Office located in 92128 - VINTAGE of Building is 1997 - Existing Chiller: 350 tons, water-cooled, centrifugal

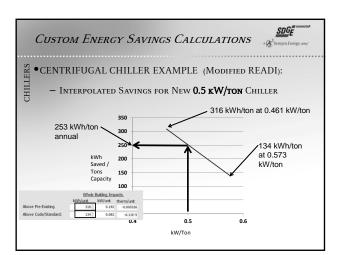

- PROPOSED CHILLER: 350 TONS, WATER-COOLED, CENTRIFUGAL, EFFICIENCY = 0.461 kW/TON
- DEER EUL = 20 years; Title 24 = 0.573 kW/ton

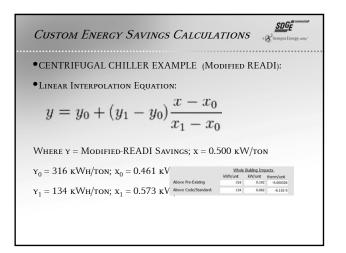

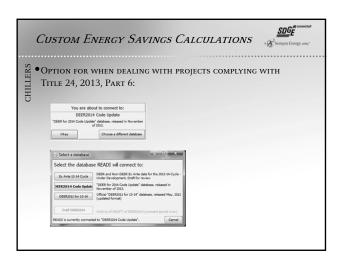

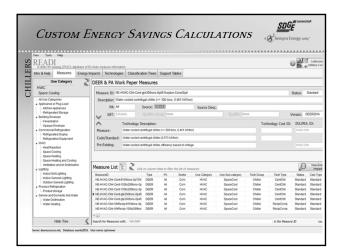

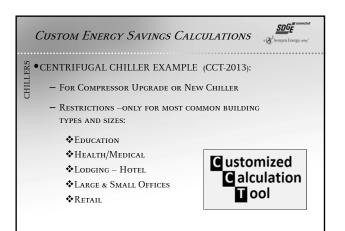

С		Energy Savin	igs Calculat.	IONS	A C Sempra Energy usey

 COMPRESSED AIR - TITLE 24 REQUIREMENT:
 New compressed air systems, and all additions or alterations of compressed air systems where the total combined compressor pow is > 25 HP;
 The compressed air system shall be equipped with an appropriate acceptable. COMPRESSED AIR SYSTEMS WHERE THE TOTAL COMBINED COMPRESSOR POWER

- SIZED TRIM COMPRESSOR AND PRIMARY STORAGE TO PROVIDE ACCEPTABLE PERFORMANCE ACROSS THE RANGE OF A SYSTEM AND TO AVOID CONTROL GAPS;
  - Compressed air systems with more than one compressor, having a combined horsepower rating > 100 Hp, must operate with an APPROVED CONTROLLER THAT IS ABLE TO CHOOSE THE MOST ENERGY EFFICIENT COMBINATION OF COMPRESSORS WITHIN THE SYSTEM BASED ON THE CURRENT AIR DEMAND AS MEASURED BY A SENSOR.

 • AIR COMPRESSOR 2013 CODE REQUIREMENTS:
 -Subsection 120.6(e): The proposed regulations add subsection to add requirements for compressed air systems 25hp or more:
 • Trim compressor- (compressors with variable capability so that they can be operated to -Subsection 120.6(E): The proposed regulations add this SUBSECTION TO ADD REQUIREMENTS FOR COMPRESSED AIR

SDGE

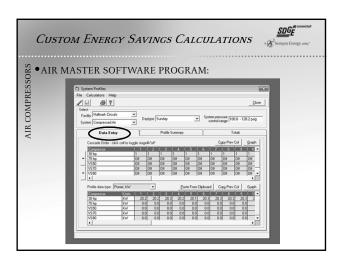

•TRIM COMPRESSOR- (COMPRESSORS WITH VARIABLE SPEED CAPABILITY SO THAT THEY CAN BE OPERATED TO SPECIFICALLY MEET THE COMPRESSED AIR LOAD), STORAGE, AND SYSTEM CONTROLS;

•Construction, inspection, and functional testing.

SDGE

SDGE

- - ➢ MANUFACTURES EQUIPMENT SPECIFICATIONS CUT-SHEET

  - Engineer of Record and or Trade Professional Contractor
  - SDG&E Pre & Post Inspections (mandatory)
  - $\blacktriangleright$  Measurement and Verification Plan (may be required)
  - $\succ$  Installation must be completed within Program Year (refer to website)
  - Custom Calculations require SDG&E Engineering and or CPUC review
  - ➢ PROCESSING DELAYS
  - ➢ Post M&V SDG&E review
  - Must notify SDG&E of equipment or design changes

# CUSTOM ENERGY SAVINGS CALCULATIONS

FOR

VSD's F

- For Fan Applications on existing HVAC Systems
- Supply, Return, Exhaust systems
- Maximum size is 100 HP/fan motor
- Eligible only if Throttling devices are Removed OR PERMANENTLY DISABLED
- Current Rebate is \$110.00/hp
- Must be SDG&E customer
- PRE-INSPECTION WILL BE REQUIRED

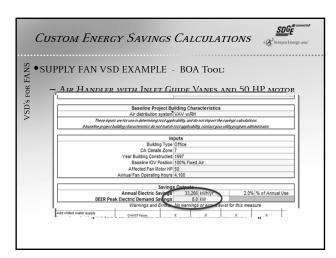

SDGE

# SN • VSD FOR HVAC FANS - INCENTIVES: # # For Fan Applications on existing H

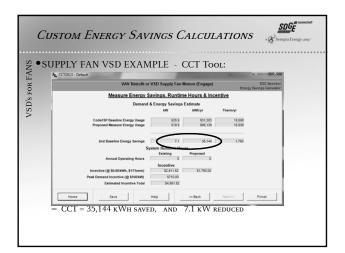

- For Fan Applications on existing HVAC Systems
- Supply, Return, Exhaust systems
- More than 100 HP Motors

VSD's

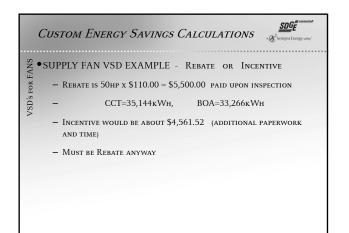

- Eligible only if Throttling devices are Removed OR PERMANENTLY DISABLED
- Incentives available for replacement of failed VSDs if an incentive on failed VSD had not BEEN PAID WITHIN PREVIOUS 5 YEARS
- Current Incentive is \$0.08/kWh and \$150/kW
